

MULTINATIONAL TIME USE STUDY

USER'S GUIDE AND DOCUMENTATION

Version 7

11 June 2015

Kimberly Fisher and Jonathan Gershuny

With contributions from: Evrim Altintas and Anne H. Gauthier

With further contributions from:

Alyssa Borkosky, Anita Bortnik, Michael Corey, Donna Dosman, Cara Fedick, Tyler Frederick, Thomas Grund, Sally Jones, Jiweon Jun, Ladislav Kozak, Aaron Lai, Qianhan Lin, Tingting Lu, Fiona Lui, Leslie MacRae, Berenice Monna, José Ignacio Giménez Nadal, Monica Pauls, Cori Pawlak, Almudena Sevilla-Sanz, Andrew Shipley, Cecilia Tinonin, Nuno Torres, Charlemaigne Victorino, and Oi-Ching Yeung

Important:

This User Guide and Documentation pertains to Release 7 of dataset and replaces Releases 6 (December 2013), 5 (October 2012), 4 (October 2011), 3 (March 2009), 2 (May2005) and 1 (March 2003). Errors have been corrected, new surveys have been added, and the old files have been reformatted.

Acknowledgements

The development of the Multinational Time Use Study (MTUS) spanned several decades, involved numerous research assistants, and various sources of funding. The authors of this User's Guide are particularly grateful to our statistical partners without whom MTUS would not have been possible. We especially appreciate their willingness to share the datasets with us and to answer our numerous questions about them.

It would be impossible to list all of them. Among our many collaborators, we are grateful to Michael Bittman (Australia), Jens Bonke (Denmark), Koen Breedveld (Netherlands), Françoise Dumontier (France), Manfred Ehling (Germany), Andrew Harvey (Canada), Duncan Ironmonger (Australia), Glenn Moss (South Africa), Iiris Niemi (Finland), Hannu Pääkkönen (Finland), Maria Clelia Romano (Italy), John Robinson (United States), Klas Rydenstam (Sweden), Endre Sik (Hungary), Faye Soupourmas (Australia), Jay Stewart (USA), Oriel Sullivan (Israel), and Odd Frank Vaage (Norway).

Our most recent collaborations entail work with The Maryland Population Research Center (Sandra Hofferth, Katharine Abraham) and the Minnesota Population Centre (Sarah Flood and Matthew Sobek), as well as work with the Centre for Time Use Research website provider, Wizzard Solutions Limited, who all are committed to increasing the accessibility and ease of use of time use data.

In addition, we are grateful to the following national statistical agencies: the Australian Bureau of Statistics (ABS), the Austrian Central Statistical Office, the French National Institute of Statistics and Economic Studies (INSEE), the German Federal Statistical Office, the Instituto Nacional de Estadistica of Spain, the Instituto Nacional de Estatistica (INE) of Portugal, the Italian National Statistical Institute (ISTAT), Statistics Canada, Statistics Finland, Statistics Korea, Statistics Norway, Statistical Office of the Republic of Slovenia, Statistics South Africa, Statistics Sweden, the United Kingdom Office for National Statistics (ONS), and the United States Bureau of Labor Statistics.

We are also grateful to the following funding agencies which have supported our research program over the years: the Canada Research Chair Program, the Canadian Social Sciences and Humanities Research Council, the Economic and Social Research Council (ESRC - UK) (Developing the Centre for Time Use Research RES-060-25-0037 from 2008-2013; previously Time Use Studies: Daily Life and Social Change RES-000-23-TO704 and RES-000-23-TO704-A), the European Foundation for the Improvement of Living and Working Conditions

(EFILWC) (Ireland), the Office for National Statistics (ONS) (UK), the University of Essex (UK), the University of Melbourne (Australia), and The Joseph Rowntree Memorial Trust (UK). The authors of this User's Guide take full responsibilities for omissions and errors.

Disclaimer

Although we aimed at the highest level of accuracy when preparing this document, errors are possible. Users of the MTUS dataset do so at their own risk. Note also that the User's Guide and individual survey documentation thoroughly document the recoding of the harmonised variables for the Release 6 version of the harmonised episode, aggregate and simple files. In addition to adding new data, the MTUS team undertake periodic reviews and upgrades of all surveys included in this dataset.

INTRODUCTION

This User's Guide and Documentation is the companion document to the MTUS dataset. Information on <u>other time use surveys not included in the harmonised</u> <u>dataset</u> are included on the Centre for Time Use Research web site. This User Guide is publicly available. <u>Access to the data</u> is however restricted and requires authorization. This User Guide and Documentation pertains to Release 6 of the Harmonised Episode, Aggregate and Simply datasets, and replaces Release 5 (October 2012).

The User's Guide describes the structure of the MTUS dataset and discusses issues of comparability across surveys.

The current version of this User's Guide covers the following surveys:

- Australia 1974, 1987, 1992, 1997, 2006
- Austria 1992
- Canada 1971-72, 1981, 1986, 1992, 1998
- Denmark 1964, 1987, 2001
- Finland 1979, 1987/88, 1999
- France 1966, 1974, 1985, 1998, 2009-10
- Germany 1965, 1991-92, 2001
- Israel 1991-92
- Italy 1979, 1989, 2003
- The Netherlands 1975, 1980, 1985, 1990, 1995, 2000, 2005
- Norway 1971, 1981, 1990/91, 2000
- Republic of Korea 2009
- Slovenia 1965, 2000
- Spain (national) 2002-03, 2009-10, Basque Country in Spain 1992-93, 1997-98, 2002-03, 2008-09
- South Africa 2000
- Sweden 1990/91, 2000
- UK 1961, 1974-75, 1983, 1987, 1995, 2000-01, 2005
- USA 1965-66, 1975-76, 1985, 1992-94, 1994-95, 1998-01, 2003-12

This User's Guide describes the surveys and the various harmonised variables. It also discusses the weighting of time use survey as well as the methods of analysis of time use data. Survey-specific information regarding the coding of harmonised variables appear separately in

the README documents and transformation files for each individual survey. These are available by clicking on the year of the surveys in the row for each country included in the <u>on-line documentation</u>.

The MTUS team also has produced a separate <u>Coding Procedure Document</u> which covers the information in this document of greatest use to people harmonising the MTUS files, as well as supplementary information relating to the conversion process. This document is available on-line.

CHAPTER 1: OVERVIEW OF THE MTUS

1.1 Introduction

The origins of the Multinational Time Use Study (MTUS) go back to the 1970s following an initiative of Professor Jonathan Gershuny. The idea was to create a cross-nationally harmonised set of time use surveys composed of comparably recoded variables. A detailed discussion of the historical development of the MTUS appears in Chapter 2.

The MTUS archive, located at the Centre for Time Use Research in the Department of Sociology at the University of Oxford includes:

- Original files and documentation: Episode and aggregate files, not generally available for distribution except be arrangement with the data provider. In some cases, CTUR only holds an interim version of the original data or only the MTUS version of the data.
- Harmonised simple file (HSF): A harmonised aggregate file with all surveys from all countries except those surveys collected by the Australian Bureau of Statistics, Statistics Finland and Statistics Sweden. In this file, each row represents a 24-hour observation (diary). This file covers summary time in a simplified range of 25 time use activity categories. This dataset draws first from surveys harmonised to the current MTUS standards. We also have replaced data that was available only in the older versions of the MTUS, though surveys that have yet to be upgraded from the old to the new version of the MTUS have less complete information in this format. Full details of the conversion process are explained in the MTUS coding procedures document. Appendix 3 details variable coding issues related to files yet to be upgraded from older versions.
- Harmonised aggregate files (HAF): Two harmonised aggregate files (one for adult diarists aged 18+ and a separate file for diarists aged less than 18) for a smaller sub-set of the surveys. Like the simple file, these files cover summary time in a wider range of 69 activity categories, total time with a spouse or partner for diarists in couples, and a wider range of survey, household and person-level variables. Each row represents a 24-hour diary.

- **Harmonised episode file (HEF)**: Two harmonised episode files (one for adult diarists aged 18+ and a separate file for diarists aged less than 18) for the smaller subset of the surveys included in the Harmonised aggregate files. These files include identifier variables, sex, age, and diary details: main activity, coded in the 69 category frame and an older 41 category code frame; secondary activity in the 69 category frame, location, mode of transport whether diarists used the internet or computers during the episode, and who else was present. In these files, rows represent a change in any element of the diary report.
- Restricted files for Australia, Finland and Sweden, are released separately and require additional permission to access.
- <u>Supplementary files</u> with region and ethnicity variables for a small selection of the surveys, additional variables for the UK, and special documentation for using the diaries from children, as well as a special collection of surveys from the USA (the <u>American Heritage Time Use</u> <u>Study – AHTUS</u>) also are available on the MTUS and CTUR websites.

Three variables have only harmonised column names, but original survey categories: EDUCA, INCORIG and EMPINCLM. The labels for the categories for each individual survey are included in the <u>readme files for each survey</u>. These variables enable users to construct their own customised variables. **NOTE THAT EDUCA, INCORIG and EMPINCLM ARE NOT SUITED TO CROSS-NATIONAL ANALYSIS UNTIL AFTER THE USER MAKES TRANSFORMATIONS REQUIRED FOR EACH ANALYTIC PURPOSE.**

We split the megafiles into child and adult files for two reasons. First, the age of the youngest diarists vary highly across the surveys. Also, as children's time use differs markedly from the activities of adults, excluding children from the main file increases the harmonisation of the adult files. Additionally, there are a number of surveys that only sampled young people. We hope in the future to include some of these surveys in the child files.

1.2 Format and structure of the datasets

The harmonised surveys are saved in **SPSS**, **STATA**, and **Flat text** formats. People who download the flat text files can access the variable and value labels in both English (Appendix 1) and Spanish (Appendix 2).

In most descriptive analyses, MTUS Users are encouraged to use all cases and disregard the fact that the total number of cases (diaries) correspond to a smaller

number of respondents for some surveys. However, when carrying out analyses based on inferential statistics, MTUS users should be aware of the nonindependence of cases and should use appropriate statistical techniques for those surveys which collected multiple diaries from the same respondent.

The MTUS only includes cases where participants completed diaries. MTUS weights also permit users to analyse only good quality diary cases. Some original surveys also include information on partial participants and non-respondents, but to access this information, users would need to match back to original data. MTUS identifiers can readily be renamed to original survey identifiers to facilitate such matching.

The MTUS team has undertaken substantial data preparation and cleaning work, and produced added value variables not available in original surveys.

The time use diary is a narrative account and not a series of quantitative questionnaire answers. People can give a full account of their day without necessarily completing all columns of the diary for all potential time slots. For example, when offered a main activity and a mode of transport column, some diarists opt to make a time-saving minimal entry of writing "drove car" or "train" in the mode of transport column while not recording anything in the main activity column when their activity is transport. We consider entries across the whole diary to define the main activity, not just the information recorded in the main activity column.

We use full diary reports to add detail to some incomplete reports in three specific instances. In cases where the main activity is missing at the beginning or end of the diary day, where the diarist records being at home or at another person's home, where the subsequent activities after the initial gap at the beginning or the preceding activities before the final gap at the end of the diary day are the sorts of activities which typically follow or precede sleep (have a drink, low-activity leisure like watch TV or read, dress/undress, personal care) we presume the missing activity to be sleep. (We make this assumption both on account of the pattern of activity and as time-diary surveys tend to start the observation window as a point of the day when most people in the population are asleep). Second, in circumstances of a missing period of 25 or fewer minutes that precedes leaving home to travel somewhere else or following returning home after travel from activities away from home, we assume the missing activity to include a combination of personal and household care. The documentation specific to each survey (conversion files) includes information on the number of cases amended by these procedures. Finally, where the diarist gives location information indicating that they are not at home but records no activity, we mark the case with the category unknown activity away from home on the newer 69

category activity code frame (though these cases are treated as missing time on the older 41 category activity list).

The MTUS team does not alter participant reports. Where an activity seems unusual, such as walking at home (which may occur on a treadmill), or food preparation while travelling (which a passenger might undertake in limited circumstances), we do not overwrite and change priority of the original account. We also **do not impute** data based on estimations from what similar people do on similar days. All adjustments to diaries work from information that the participant supplies.

After this data preparation work, we define any diary to be low quality, when:

- continues to have 91 or more minutes of missing time,
- it has fewer than 7 episodes,
- it is missing two or more of four basic activities, or
- it was filled in by a diarist whose age or sex is not known.

We define the four basic activities as those necessary for basic functioning on a day-to-day basis:

- eating or drinking (measured by time in these activities, or time recorded working with food (set or clear table, food preparation, cooking and the like), or the diarist being in a location where they are likely to be around food and drink, that is attending a feast or being at a pub or in a restaurant);
- 2) sleep or rest (including do nothing, think, time out, or take a work break)
- 3) personal care (including assumed self care preceding or following travel and receiving personal services, such as at hair dresser or doctor)
- 4) exercise and/or travel (including leisure excursions, gardening, walk dogs, imputed travel where no activity is recorded but the diarist records a change of location or records a mode of transport).

Diaries with large volumes of missing time do not account for enough of the day to allow imputation of what is likely to have taken place in the missing periods.

Very low episode diaries and diaries missing basic activities do not give complete accounts of the day, and both lead to over-estimates of the activities the diarist did record and under-estimates of the activities the diarist did not record. Age and sex are two variables highly associated with specific time use patterns, and these variables are required for the creation of the recommended weight.

We make five exceptions in relation to these quality rules.

- Diarists may not record any travel when their travel episodes are very short, but may record a pattern in the diary that lets us know that they did travel and where in the day the travel took place. In such diaries, you will find patterns of continuous reports of activity, and a change of location (such as eating breakfast at home then doing paid work at the office) with no report of travel in between the change of location. We handle these cases by making a flag variable for unreported travel present (0=no such missed travel, 1=missed travel). If the diary includes 2 of the 4 basic activities, one of the 2 missing activities is exercise or travel and the diary is flagged as including missing travel, then we count this diary as a good diary. We do not alter the diary record in such cases, and users of the MTUS would have to make their own adjustments to the entries made by the diarists if they wish to account for such travel.
- Diarists may not record any personal care when their episodes of personal care are short. In such diaries, you will find patterns of continuous reports of activity, and transitions where personal care is highly likely to have occurred (sleep for 2+ hours at home followed by other activities with no care, eating meals at home where the meal consumption lasts at least 10 minutes followed by other activities with no record of personal care). If such patterns are present, we make a flag variable for unreported personal care (0=no, 1=yes). If the diary is missing 2 basic activities, and one of these missing activities is personal care and we can flag this diary as having unreported personal care the diary record in such cases, and users of the MTUS would have to make their own adjustments to the entries made by the diarists if they wish to account for such personal care.
- Diaries of carers (either the variable "carer" flagging cases of people who look after an adult needing assistance =1 for yes, or the diary includes any time in any form of adult or childcare) who otherwise meet the other 4 good diary criteria count as good diaries.
- Diaries including only 2 of the basic activities but that have at least 12 episodes where the diarist reports being at home all day (defined as no travel but eloc=1 own home, or eloc=2 other's home for at least 1000 minutes), but otherwise meet the other 4 good diary criteria count as good diaries.
- Other diaries including only 2 of the basic activities and 15 or more episodes count as good diaries.

Some original surveys additionally include row cases for non-respondents who do not complete a diary. Nevertheless, most of the surveys do not include

specific information on non-respondents in the data files. The MTUS format provides a suitable platform to analyse good-quality diaries as well as low-quality diaries, but users would need to take greater account of original survey information to investigate people who do not respond at all. When original surveys include case rows for non-diarists (people with 24 hours of no reported activity), we delete the non-diary cases.

1.3 Surveys included

The following table lists all the surveys included in MTUS, as well as the surveys that we hope to include in coming years. Users should note that data included only in the harmonised simple file that are drawn from an old version of the MTUS but which have not yet been upgraded are not converted to the same standard as the rest of the MTUS and do not contain the same detail of information.

Notes:

- 1- More countries have carried out time use surveys. A more comprehensive list is available at the CTUR web site.
- 2- Unless otherwise indicated, the sample size refers to the number of individuals. The actual number of cases is larger in surveys where 2 or 3 diaries were collected.
- 3- 'Period' refers to different collection periods throughout the year.
- 4- Indicates whether or not more than 1 household member was included in the survey.
- 5- The South African diary includes 30 minute intervals. People could nominate multiple activities, and if they nominated more than 1 activity, were asked in the activities were simultaneous or consecutive. The original file codes multiple consecutive activities in 10 as well as 15 minute intervals.
- 6- The UK 1974-75 survey collected 4 rounds of 1 week diaries. Only the Monday and Tuesday diaries remain for the collection wave that took place in September 1974. The 1983-84 and 1987 surveys are treated as a single survey in the recent versions, though the variable msamp allows the user to distinguish between the two surveys.

1.5 File naming conventions

We have standardised MTUS file names. The name of each file distinguishes:

- The country (2 or 3-letter code) (see table below)
- The first year in which the survey started data collection (4-digit)
- The version of the archive (HEF, HAF, HSF)
- The type of file (extensions 'sav' or 'dta' for data files, and extensions 'sps' or 'do' for programme files)

For example, Release 2 of the HEF version of Spain 2009-2010 is called 'es2009hef.sav', which should be read as:

Country: es (for Spain) Year: 2009 (the first year in which data collection took place) Version: hef (harmonised episode file) Type: sav (an SPSS file)

Country	Code	Country	Code	Country	Code

1.6 Missing value conventions

We use three codes to mark missing values, and a separate fourth convention for weights and identifier variables that are not present, as follows:

- "-7" refers to situations for we can create a variable for this survey, but we cannot create the variable for this diarist (or diary) as the respondent was not asked for the information on this diary or because the information is not relevant to that respondent (such as the employment status of a spouse for a person who is single and not living with a co-habiting partner). Although this missing value option potentially applies to all variables, it is mainly used for AGEKIDX, AGEKID2, WORKHRS, EMPSP, PARNTID1, PARNTID2, PARTID and EMPINCLM.
- "-8" refers to situations where we can create the harmonised variable for the study, but no information is recorded for this case (item non-response or insufficient information to create the variable for that case).
- "-9" refers to situations for which the harmonised variable could not be computed for the survey (with exceptions for weights and case identifier variables – although the identifier of spouse or of parents can have a -8 value if this could not be created for a case). Note that we use -9 with the time use activity variables to distinguish true 0s (the diarist did not record any time in this activity, though in theory they could have done so) from cases where no time is recorded in the activity because we could not create this time use category for this survey.

There are cases where an original weight is not present. In these cases, we use "0" rather than a missing value to indicate that this weight is not present in the study (and anyone attempting to use this weight would find they have no cases

remaining for analysis from the survey). The conventions for the identifiers are set out in detail below.

Users also should note that we do not use missing values for the aggregated or summary time use variables, unless the category is not available for the whole survey. A value of 0 means that the diarist did not record any minutes in the activity (it is impossible to say for certain if this is because the diarist did not do any of the activity or if the diarist actually did undertake the activity but did not report doing the activity in the diary). If a category is not coded in the survey, then the summary value is set to -9 for the whole survey. Users should take notice of -9 values. If one sums time across a variable that cannot be created for a survey without first addressing the missing categories, 9 minutes will be subtracted in error for each category that is not present.

There are no system missing cases in MTUS data files. All cases for all variables have either a valid value or a standardised missing value. The MTUS data files contain no declared missing values. MTUS users need to declare missing values if they choose to do so before running their analysis.

1.7 Data preparation

The Harmonised Aggregate Files (HAF) and the Harmonised Simple File (HSF) offer **aggregate (summary)** versions of the time-use surveys, where each row case in the dataset reflects a record in one 24-hour time diary. For those studies where respondents completed more than one diary, individual diarists appear on a separate row for each diary they completed. The HAF and HSF include survey, demographic and socioeconomic information about respondents (hereafter called diarists) and their households alongside the aggregated time-use variables.

The Harmonised Episode Files (HEF) cover sequence information. In the HEF, each row case represents one episode, or change of main activity, secondary activity, location, use of computers or the internet, mode of transport, or presence of others, in a diary. Where the diarist completed more than one diary, the episodes of the subsequent diary or diaries follow the episodes of the first diary. As the HEF files are large, only the identifiers, age and sex are included in the HEF alongside the diary information. Users will need to match the HEF with the HAF file to pick up the corresponding background variables.

The process of making the HAF and HEF files takes around three to five weeks of cumbersome work, and can take longer in the case of older time use surveys where information is reported in uneven intervals and more considerable efforts

are required to resolve errors in original files. For this reason, only a limited number of surveys will be coded into the HAF and HEF formats. More surveys will be included only in the simpler HSF format.

Before beginning the actual conversion, users should undertake three steps to ensure maximum data quality.

DATA PREPARATION STEP 1 – Check alternative options for the MTUS background variables to ensure that you are using the option with the cleanest profile compared with other reported results and the least missing data. If there are options and one is better than others, the choice should be documented in the conversion syntax and the Readme file. In some cases, combinations of original variables are needed to create the MTUS variables. We also triangulate information in files to use any available information to fill gaps, not to impute data, but to make maximum use of the information coded in the file. As an example, a diarist may have no answer recorded for the question of marital status. Nevertheless, a household grid may show that this person is the spouse of another diarist, and this person may report time with this spouse in the diary, and this diarist's diary may match patterns the spouse reports being with this diarist, indicating that the person is in a couple even though the couple variable has a missing value.

DATA PREPARATION STEP 2 – Apparently missing main activity time in diaries is not necessarily missing. The point of the diary is to collect information about what people are doing at any point in time. Diarists sometimes do not fill in the main activity column – creating the appearance of missing data, but fill in other information elsewhere in the diary that nonetheless indicates their activity and allows us to properly code the time period. We should recognise that elements of the diary are not always separate. At points of overlap, diarists can record a comprehensible and clear response in the diary in one place but not in others. For example, an entry "took train to work" is both a location/mode of transport and an activity, and this dual meaning is clear even if the entry is written only once in either the main activity column or the location column. The redundancy of writing the same entry in two places is not necessary for the diary to have a full account of a participant's activities. We recommend the following steps be undertaken where a main activity is missing before converting the data:

a) Completing a time diary can be an onerous task, and some diarists do not appreciate making redundant entries. Where diaries have a location or mode of transport column and the diarist is travelling, some diarists may write "drive my car to work" or "on the bus" in the mode of transport column and see no point in writing the same entry in the activity column. When main activity is missing but the diarist has recorded a mode of

transport during this time period, we recode the missing main activity slot as unspecified travel (main=62).

- b) Some diarists get confused while they complete the diary in a hurry, and may record the main activity in the secondary activity column. Another possibility is that a diarist may be undertaking a series of main activities while also doing an extended secondary activity for instance alternating between care of pets, care of children and housework as main activities while listening to the radio. An item on the radio may be particularly interesting and attract the diarist's full attention for 10 minutes, but the 10 minutes of main activity radio listening is more efficiently recorded by simply extending the radio listening recorded in the secondary activity is recorded, we recode the main activity as the reported second activity. These are cases where the diarist has reported one valid activity.
- c) For short gaps in the early hours at the beginning or end of the diary where the diarist is at home or in the same location where they report sleeping on the diary day and asleep before the gap at the end of the diary, or asleep following the gap at the beginning of the diary, we recode the gap as imputed sleep.
- d) If a short gap (<25 minutes) occurs at home just before travel or at home just after travel home, set the missing time to imputed personal and household care
- e) If there is other diary information that illuminates the activity in an episode where there is no recorded main activity, this should be used to identify the activity. As some examples, individual surveys in the past have recorded information as the number of cigarettes smoked during the episode, which television station the diarist watched if they watched TV during the episode, which type of material the diarist read if they read during the episode, and the like. Similar to the instance of the diarist recording a mode of transport but not recording a main activity, a diarist might record that they smoked 10 cigarettes in 15 minutes or watched a specific television station for 45 minutes but not record a main activity. Nonetheless, such records do reveal what the diarist was doing, so can be used to complete apparently missing time episodes.

All these changes are making use of information the diarist supplied about their activity, and this procedure eliminates some unnecessary wastage of diaries. All such data cleaning should be fully documented in the conversion programme.

DATA PREPARATION STEP 3 – Check to see if other diary information facilitates the coding of time use activities. Different studies code activities in different ways. Sometimes researchers need to use multiple columns from the

diary to code a single activity. For instance, some surveys simply code "eating/drinking" in the main activity, and the location variable is needed to distinguish meal breaks at work (Main=5), from eating out in a restaurant (Main=39), from eating meals at home or elsewhere (Main=6). Likewise, location can distinguish paid work at home (Main=8) from paid work away from home (Main=7). Who else is present information sometimes is needed to distinguish childcare from adult care. Some cases arise peculiar to only one dataset. For instance, Denmark 1964 includes an original code for all media use, but also has a separate column where diarists indicated what media they were reading, watching, or listening to, and this second column enables the separate coding of listening to the radio (Main=58) from watching TV (Main=59) to listening to music (Main=57). All combinations of information used to code a category should be included in the documentation.

We engage in a series of quality checks in the post-harmonisation process. These quality checks are detailed in Section 11 (Quality checks) of the MTUS coding procedures document available elsewhere on the <u>MTUS web pages</u>.

1.8 Identifying good-quality diaries

Diaries with large volumes of missing time do not account for enough of the day to allow imputation of what is likely to have taken place in the missing periods. Low episode diaries and diaries missing basic activities do not give complete accounts of the day. Low quality diaries lead to over-estimates of the activities the diarist does record and under-estimates of the activities the diarist did not record. Age, sex and day of the week are highly associated with specific time use patterns, and these variables are required for the creation of the recommended weight. We also classify diaries missing age or sex of the diarist or the day of the week on which the diary was completed as low quality diaries.

For this reason, the MTUS includes the variable BADCASE to distinguish good quality diaries from diaries lacking sufficient standards for analysis. The MTUS team defines any diary which:

- o continues to have 91 or more minutes of missing time after data cleaning,
- o which has fewer than 7 episodes,
- which is missing two or more of four basic activities with 5 exceptions (defined below)

The four basic activities necessary for basic day-to-day functioning are:

- eating or drinking (measured by time in these activities, or time recorded working with food (set or clear table, food preparation, cooking and the like), or the diarist being in a location where they are likely to be around food and drink, that is attending a feast or being at a pub or in a restaurant);
- sleep or rest (including do nothing, think, time out, or take a work break)
- personal care (including assumed self care preceding or following travel and receiving personal services, such as at hair dresser or doctor)
- exercise and/or travel (including leisure excursions, gardening, walk dogs, imputed travel where no activity is recorded but the diarist records a change of location or records a mode of transport).

The five exceptions where MTUS does not count a diary as being low quality if the only problematic dimension is missing two or more of four basic domains of activities are as follows:

- Diarists may not record any travel when their travel episodes are very short, but may record a pattern in the diary that lets us know that they did travel and where in the day the travel took place. In such diaries, you will find patterns of continuous reports of activity, and a change of location (such as eating breakfast at home then doing paid work at the office) with no report of travel in between the change of location. We handle these cases by making a flag variable for unreported travel present (0=no such missed travel, 1=missed travel). If the diary includes 2 of the 4 basic activities, one of the 2 missing activities is exercise or travel and the diary is flagged as including missing travel, then we count this diary as a good diary. We do not alter the diary record in such cases, and users of the MTUS would have to make their own adjustments to the entries made by the diarists if they wish to account for such travel.
- Diarists may not record any personal care when their episodes of personal care are short. In such diaries, you will find patterns of continuous reports of activity, and transitions where personal care is highly likely to have occurred (sleep for 2+ hours at home followed by other activities with no care, eating meals at home where the meal consumption lasts at least 10 minutes followed by other activities with no record of personal care). If such patterns are present, we make a flag variable for unreported personal care (0=no, 1=yes). If the diary is missing 2 basic activities, and one of these missing activities is personal care and we can flag this diary as having unreported personal

care patterns, then we count this diary as a good diary. We do not alter the diary record in such cases, and users of the MTUS would have to make their own adjustments to the entries made by the diarists if they wish to account for such personal care.

- Diaries of carers (either the variable "carer" flagging cases of people who look after an adult needing assistance =1 for yes, or the diary includes any time in any form of adult or childcare) who otherwise meet the other 4 good diary criteria count as good diaries.
- Diaries including only 2 of the basic activities but that have at least 12 episodes where the diarist reports being at home all day (defined as no travel but eloc=1 own home, or eloc=2 other's home for at least 1000 minutes), but otherwise meet the other 4 good diary criteria count as good diaries.
- Other diaries including only 2 of the basic activities and 15 or more episodes count as good diaries.
- o which was filled in by a diarist whose age or sex is not known,

• the day of the week on which the diary was completed is not know to be low-quality.

Note that only good-quality diaries have positive values in PROPWT. Low-quality diaries should have 0 values on PROPWT.

Some original surveys additionally include row cases for non-respondents who do not complete a diary. Nevertheless, most of the surveys do not include specific information on non-respondents in the data files. The MTUS format provides a suitable platform to analyse good-quality diaries as well as low-quality diaries, but users would need to take greater account of original survey information to investigate people who do not respond at all. Where original surveys include case rows for non-diarists (people with 24 hours of no reported activity), we delete the non-diary cases.

CHAPTER 2: HISTORICAL DEVELOPMENT OF THE MTUS

Though some early research compared time use in the United States and the then USSR, comparative time use research work began effectively with the first cross-national study funded by the UNESCO in the 1960s and led by the Hungarian Sandor (Alexander) Szalai. This study collected time use surveys in twelve countries. The Szalai project drew both on the expertise in diary design that had emerged in the Soviet Union and Eastern Europe, and on the new data processing capabilities emerging in Western Europe and particularly North America. John Robinson, still (in 2013) actively writing comparative papers on social indicators using time diaries, and then the US Project Director working, in the late-1960s, at the University of Michigan, with the Principle Researcher Philip Stone, was responsible for the computer processing of the comparative survey materials.

The diary designed by Szalai's UNESCO team, with separate recording fields reserved for primary activity, any simultaneous secondary activity, location and co-presence information, was collected as a face-to-face "what did you do yesterday?" interview, and served as the basis for most modern time use studies. Indeed, the fact that this common model was adopted independently by a very wide range of countries for subsequent national studies, is a large part of explanation of the success of the post-fieldwork harmonisation strategy adopted for the MTUS.

The MTUS process has undergone a variety of iterations over the years. This chapter charts that history, and documents variables and guiding ideas that appeared in earlier versions.

2.1 Theoretical origins and the search for data

The ultimate origin of the Multinational Time Use Study is a 1970s study of "postindustrial society". The US sociologist Daniel Bell (1976) advanced the hypothesis that post industrial "service economies" emerge as a result of an extension of the 19th century "Engel's Law" which holds that households, as they get richer, spend ever-larger proportions of their money income on the purchase of services. Gershuny (1978), investigating the empirical basis of this claim using

historical changes in (expenditure diary-based) household consumption estimates, arrived at a fully counter-intuitive result. Though employment in services occupations was increasing, household expenditure on services, when appropriately deflated by specific price indexes, was rapidly declining. Households were substituting the purchase of manufactured goods (and associated infrastructural provisions) for services, and then producing the final services outside the money economy: private cars substituting for transport services, televisions for cinemas, washing machines for laundry services and so on. (The resulting paradox, of growing service employment with declining service consumption, is explained by the growth in the number of "knowledge work" service jobs involved in the increasingly sophisticated manufacturing technology.)

There was, in effect, a "self-servicing" sector of economic activity growing rapidly, and largely unnoticed by policymakers, outside the measured GNP—a phenomenon analogous to the late 19th century finding (by the British economist and social statistician Robert Giffen) that the as-yet un-named service sector of the British economy (catering for what Giffen in 1883 called "incorporeal functions") should be included in the national product (summarised in Gershuny 1978, 2000). But as Giffen also found, statistics for this sort of activity were almost entirely lacking. Hildegarde Kneeland (1929), an early pioneer in this field, strove to fill this gap by systematically collected time diary samples were the only possible source for information on unpaid domestic production.

The cross-national comparative extension of this 1970s research, funded largely by the EU "Forecasting and Assessment of Science and Technology" (FAST) programme, shaped the subsequent structure of the MTUS. In 1978, Gershuny's first attempt was to find UK diary evidence for extra-economic activity led him to the BBC viewer/listener survey 1974/5, the results of which were in the course of publication by the BBC Audience Research Department. He met John Robinson, then on a sabbatical from the University of Michigan, a visitor at the BBC, investigating the comprehensibility of news broadcasts, and together they searched for, and ultimately found, the original diaries from the 1961 BBC national viewer/listener availability survey (which lay abandoned in the basement of the BBC staff club, now the Langham Hotel, in a pile of egg boxes and tea chests). These 2,500 7-day diaries, recoded to correspond to the Szalai activity classification, and combined with the 1974-75 materials, (and a smaller 1970 diary study, itself using a version of the Szalai instrument) conducted by the sociologists Michael Young and Peter Willmott, (1975) provided the first baseline for estimating historical change in time use in the UK.

2.2 Development of the MTUS and parallel cross-national projects

Jonathan Gershuny raised a series of research grants in the mid-1980s (from the UK Economic and Social Research Council, Anglo-German Foundation, German Marshall Fund, and notably the UK-based Joseph Rowntree Memorial Trust) test his original UK service economy findings using European Labour Force Surveys (LSF) and other harmonised cross-national survey materials. The same "self-servicing" or "first world informal economy" finding emerged (Gershuny 1983, Gershuny and Miles 1983). It became clear that there was need for cross-national comparative data on work outside employment to complement the LSF-type data on paid work. No source of large scale time use information had emerged subsequent to the 1960 Szalai materials. Gershuny's post-fieldwork harmonisation of British time use surveys with the Szalai data yielded promising results. The widespread adaptation of the Szalai diary design as model for a variety of independently funded national studies made this process simpler than might otherwise have been the case.

F. Thomas Juster and Frank Stafford collected a longitudinal national time diary study in the United States from 1974 to 1975 which complemented the 1965-66 national study conducted as an extension to the Szalai programme. A pairwise comparison of the US historical sequence (augmented by a subsequent 1985 national study conducted by Robinson) with the UK sequence (also extended to the mid-1980s), formed the basis for the first cross-national comparisons of diary-based evidence of historical changes in time use (initially undertaken in the early 1980s though not published until Gershuny and Robinson 1988). By this time, and under the auspices of the Working Group on Time Use Research of the International Sociological Association (which later evolved into the International sequences of time diary studies (Denmark, France, Hungary, Norway, Netherlands) had contributed their materials to the post fieldwork harmonisation effort, and the first publications of multinational comparative time use change estimates were emerging (Gershuny 1986).

The European Foundation for the Improvement of Living and Working Conditions (EFILWC) provided funding for the first official release of the MTUS (then described as the "Multinational Longitudinal Time Use Study"—this predating the current convention that reserves "longitudinal" as a description of studies with repeated measures at the individual respondent level, such as the Panel Study of Income Dynamics or the British Household Panel Study). This consisted of a seven country harmonisation (Gershuny 1990). A summary of this work presented by the EFILWC to Eurostat in 1991 led to a proposal to set in motion a

concerted Europe-wide time use data collection exercise, which subsequently contributed to the creation of the Harmonised European Time Use Surveys (HETUS). The HETUS programme collected a first tranche of input-harmonised national time-diary surveys between 1998 and 2004. Ten participating countries made data widely available for European policy analysis (Eurostat 2005). Fifteen countries later contributed data to the HETUS table generating tool maintained by Statistics Sweden. In total, 26 countries collected at least a pilot time diary survey in the first HETUS round (Fisher et. al. 2013). A similar number ultimately may participate in the second round of the HETUS surveys, which launched in 2009, though some countries which originally participated in the first round of the HETUS did not participate in the second round, while some countries that did not participate in the first round did collect surveys in the second round. Many of these are already, or will be, included in the MTUS.

2.3 Early phases of the MTUS

The 1965 Szalai surveys, which gave inspiration for the original MTUS, only sampled the working-age population (people aged 18-60) from households where at least one member was employed in an industry other than agriculture. The older versions of the MTUS restricted the diaries included to this age range. From the 1999 version, called World 5.1, we changed policy to now include all diaries collected in harmonised surveys (though those surveys originally harmonised into MTUS and not yet upgraded retain this limitation). This change was driven by research seeking to model the time use of young people and older people (Gauthier and Ferstenberg 2002, Bittman et. al. 2004).

As the post-industrial society research motivated the original development of the MTUS, the range of background variables in the early versions was limited. Prior to the W5.52 version which displaced the W5.1 all ages version, MTUS treated all diaries equally, and did not account for multiple diaries by the same person or completed by members of the same households. The W5.52 version, released from early in the 2000s, differs from previous versions by separately identifying diarists and households, by adding more details of the diary day, and by increasing the range of background variables. MTUS began with seven personand two household-level variables, with the number of person-level variables rising to 12. The W5.52 version increased the number of household-level variables to six, and the number of person-level variables to 20. The W5.52 version introduced the first elements of relationships within households - adding employment status of the spouse and the relationship between the diarist and the household reference person. The more recent W5.53 version included 11 household-level variables, and 25 person-level variables, three of which facilitate

mapping diaries between household members (for multiple diarist per household samples) - identifiers of parents, and identifiers of the spouse or partner.

While the MTUS team has developed significant data quality control procedures since 1999, in early versions, limited or no efforts were made to clean data or to account for information included across all domains of the diary. From the early versions through the World 5.52 version, diaries missing 61 or more minutes of main activity time were deleted. Using the diary processing procedures the MTUS now follows, some diaries that would have been deleted in the past now are counted as good quality diaries. MTUS processing and analysis techniques now are more sophisticated and account for other considerations in addition to reported time, and some diaries not suitable for more analysis. In addition to refining the classification of diary quality, MTUS now include all collected diaries, though we 0-weight the low-quality diaries. Nevertheless, MTUS does continue to exclude row cases of non-participants where these are included in the original data.

Some activities have changed (distinct reading by medium purchased has changed as people have more platforms one which they can read a greater variety of material, making the delivery of the text read less significant), and some new activities (use of the internet) have arisen since the initial development of the MTUS. MTUS data also now are used for a much wider range of research purposes that the early motivations. The early activity category lists no longer meet many research needs. The W5.8 version, introduced from 2007, added a more detailed and updated range of activity categories. At the same time, MTUS developed the W6 files offering episode level data and activity context data.

As the numbering system makes sense only to people who know the history of the MTUS, the current version has changed to using descriptive file names without the numbers.

2.4 Variables from older versions no longer in use

The MTUS has evolved with time. In addition to adding a number of variables, we also have dropped some variables available in earlier versions. We detail the changes and the variables no longer in use here for those users who have read research using older versions of the MTUS of who themselves have used previous versions of the files.

COUNTRY: (ancient versions of MTUS, numeric variable) Country where study conducted

This is the old variable that records the country where the survey was carried out. In this old variable, countries were given the next number as they were added to the MTUS. This variable remains solely for those users who may still have code for analysis of older versions of the MTUS.

PERIOD: Survey time period

This variable records the period during which the survey was carried out. The values range from 1961-69 (value '1') to 2000-04 (value '7'). Precise information on when the survey was carried out is recorded in the variable 'Survey'.

Note that the length of each period is not equal. Cut-off points were chosen to maximise the number of countries in each period and to ensure that there was only 1 survey per period for any specific country. In cases for which multiple surveys were available for a country during a specific period, only one of these surveys has been included in the MTUS dataset.

Value	Label

7	2000 – 2004	
8	2005 – 2009	
9	2010 – 2014	

ID: Diary identifier

In the oldest version of the MTUS, this variable served as a case id within each survey. No regard was given to multiple diaries per person or multiple diaries per household. Rather, this variable ranged in value from 1 to the highest number of diaries in the survey. This decision was recognised as a mistake, and in most versions of the MTUS, this variable distinguishes diaries, and taken alongside persid, hldid, msamp, swave, survey, and country, uniquely identifies cases.

AGE1/2: Age

This variable records the age of respondents (up to 3 digits). For surveys in which age was recorded in categories, we recoded age into a continuous variable by assigning the mid-point of each age group (e.g. 17 for age group 15-19). When surveys only included the year of birth of respondents, we computed AGE by subtracting the year of birth from the year of the survey. This variable was renamed as AGE for clarity from the release of Version 5.53.

AGEGR5Y: Five-year age groups

This variable, derived from AGE2, recorded respondent's age in 5-year bands.

Value	Label
1	0-4
2	5-9
3	10-14
4	15-19
5	20-24
6	25-29
7	30-34
8	35-39
9	40-44
10	45-49
11	50-54
12	55-59
13	60-64
14	65-69
15	70-74
16	75-79
17	80+

AGEKID: Age of youngest child in household

This variable records information on the age of the youngest child in the household. If there are no children under 18 in the household, this variable takes the value -7 (even if the original survey gives a valid value for such cases).

Value	Label
1	Youngest child between 0-4
2	Youngest child between 5-12
3	Youngest child between 13-17

This variable is highly comparable across surveys. However, the cut-off point for the age of the child varies across surveys. Also, in some surveys the data correspond to the diarist's children rather than children residing in the diarist's household. This variable has been upgraded to AGEKIDX which now includes a category for a child aged 18 or older in the household.

CPHOME: Unmarried child living in parental home²

This variable indicates whether or not diarists who are not married or cohabiting live with their parents, regardless of the diarists' age. Note that diarists who are the child of another household member who also are married can be indentified using PARNTID1 and PARNTID2.

Value	Label	
0	Not a child in parental home	
1	1 Child in parental home	

We abandoned this variable as no users worked with this variable, and the effort to create it seemed unjustified with our scarce resources. Where multiple household members completed diaries, parntid1/2 map diaries of children and parents together, and FAMSTAT=4 still marks children aged <18 living with parents or guardians.

EMPSTAT2/3: Employment status

This variable has been updated and modified slightly over various incarnations of the of MTUS. The first version, called simply EMPSTAT, had three categories, 1=Full-time employed, 2=Part-time employed, and 3=no employed. Diarists who said that they were in the military but for whom no hours of work were reported were coded as '3' (other, not employed).

We recognised this as a mistake and from version 5.51, changed category 3 to "employed, hours unknown" and coded people not employed as 4. With this change, diarists who reported serving in armed forces or otherwise being employed but whose weekly hours of work were unknown were coded as the new category 3. This recoding affected few surveys and very few cases, but to note the change, the variable was renamed EMPSTAT2.

² En español var lab cphome Hijo no casado en casa de padres. val lab cphome 0 No 1 Sí -7 "no aplica/no se preguntó" -8 no encontrado -9 no se pudo crear.

With the release of Version 5.52, we further amended the coding of this variable. In previous incarnations of the MTUS, people reporting working 30 or more hours per week were coded as working full-time. From the release of version 5.52, preference was given to self-declared full-time or part-time status. Additionally, diarists who said that they were employed but did not declare their full-time or part-time status and whose hours of work are not reported are coded as '3' (working, hours unknown) rather than missing, as had been the case in earlier versions. The variable was renamed to EMPSTAT3.

No further changes were added when the variable was renamed to EMPSTAT from the release of version 5.53 – but we felt that the variable name EMPSTAT was more clear than EMPSTAT3 – which creates the expectation that two other variables also are available in the same file. Also, few people used the MTUS in the old SPSS versions when the original variable also had this name, and we felt that the length of time which has passed justified the return to the original name with minimal chance that users might be inconvenienced.

OCCUP: Occupation³

This variable details the diarist's occupation. If the diarist is not presently employed, but there is information on the diarist's most recent occupation, use this information to code occupation.

TOTTIME: Total diary minutes per day

This variable was a constant value of 1440 – and was generated during tests that all diaries had been correctly coded. As this variable merely is an interim check and of no research value, we no longer include it.

OPOPWT: Original population weight

Where original surveys included a weight that correct for over- and/or undersampling and non-response but did not correct for the distribution of the days of

the week, we included this weight under this column heading. This weight appeared in versions World 5.0 through World 5.52.

ODAYWT: Original day weight

Some original surveys offered separate weights, one which corrected for the variation between the observed population and the respondents, and another for balancing the distribution of the days of the week (but not the sample variation from the observed population). If the original survey included separate weights, we used this name for the day of week distribution weight.

POPWT2: Post-hoc sex-age weight

Where original surveys did not include a weight that corrected for the distribution of age and sex groups in the population, we calculated such a weight on the basis of the age/sex group distribution in that country reported in an international organisation text, such as the International Labour Organization (ILO) Year Book. This weight appeared in versions World 5.0 through World 5.52.

DAYWT2: post-hoc day weight

Where original surveys did not include a weight that corrected for the distribution of the days of the week, we constructed this weight. This weight appeared in versions World 5.0 through World 5.52.

General note on older weights

All the weights in earlier versions of the Multinational Time Use Study were posthoc types, that is, weights that were computed by the MTUS team as opposed to 'original' weights computed by the statistical agencies in charge of administering each survey. These post-hoc weights were age-sex-employment specific. They were computed based on official data published in the ILO's *Year Book of Labour Statistics.* From Version 5.0 through 5.52, the original survey weights were included wherever possible, and ad hoc weights only constructed when original weights were not calculated.

SEXEMPWT: Sex, age, employment weight (not account for day)

This weight balanced the demographic distributions in accordance with ILO data. This older weight made use of employment data as well as sex and age, though has been superseded. Partly, in older and younger age categories in some

datasets, too few people were employed to allow for meaningful weights to be based (in the earliest versions of the MTUS were employment status also was used, the MTUS sample also was restricted to people aged 20-60 – the working age population). Also, in the majority of more recent surveys, weights provided with the original data account for an even wider range of demographic characteristics.

SURVWT: Weight to get 2000 per survey (not account for day of week)

This weight generally reduced the apparent size of the survey, though in a limited number of cases inflated the size of the survey to place all surveys on a comparable sample size. More recent surveys tend to have significantly larger samples, and better options are available in statistical software than were available in the mid-1980s, and we no longer make this restriction.

COUNWT: Weight to get 2000 cases per country (not account for day)

This weight created an artificial balance between the countries. When the MTUS covered a smaller scope and time period, this weight served some limited research purposes of the original creators. As more countries, some of which have many surveys over decades and some of which have only one survey, this weight no longer makes the same sense, so no longer is created.

DAYWT: Weight to balance the distribution of the days of the week

This weight balances the distribution of the days of the week for the survey.

SEDWT: Sex, and age weight from ILO data (not account for day of week)

This weight balanced the demographic distributions of sex and age only in accordance with ILO data.

SEDWT2: Sex, age, employment, and day weight

SEXEMPWT * DAYWT generates this weight. This weight is the weight most often used in the analysis of the earlier versions of the MTUS.

SEDWT3: Sex, age, employment, day and survey balance weight

SEXEMPWT * DAYWT * SURVWT generates this weight.

SEDWT4: Sex, age, employment, day, survey, and country balance weight

SEXEMPWT * DAYWT * SURVWT * COUNWT generates this weight.

22-category activity typology

Table 3.1 shows how the 41 activity category code list collapses into 22 categories. Half the categories directly map to one category on the AV41 code list. The <u>SPSS syntax which makes this collapse</u> is available on the user contributions page of the CTUR website.

CHAPTER 3: ACTIVITY CODES

MTUS is one of a number of efforts developing harmonised activity codes for cross-time and cross-national analysis of people's daily activities and use of time. Alexander Szalai (1972) developed the first such typology of 90 codes, which continued to influence code frames of other time use studies for many subsequent decades. The Szalai project concentrated on the paid and unpaid activities of the working-aged population, and also reflects the leisure and domestic technologies of its time (with concern to distinguish newspaper from book reading, radio listening from listening to records, and hand-written from telephone communication). The United Nations Statistics Division International Classification of Activities for Time-Use Statistics (ICATUS), draws on a similar concern with measuring total paid and unpaid work outputs, with aims to illuminating the total economic contributions of women - particularly in the global South, and the calculation of standard national accounts, and satellite national accounts that measure productive activities outside the paid production boundary. Most applications of the ICATUS in time use surveys reflect international-agency supported efforts to collect data to measure propensity for and actual progress of development in less industrialised countries.

Eurostat has developed the most comprehensive list of harmonised activity codes for the <u>Harmonised European Time Use Surveys</u> (HETUS) project, which includes a four-levels of progressively more detailed codes, which allow for national-level measurements at the fourth and most detailed level. More recently, the United Nations Economic Commission for Europe (2013) led a time use task force, which developed standards for comparable reporting of time use statistics for policy analysis. These guidelines specify a limited set of categories as the minimum set of activity categories required for policy-relevant time use analysis.

The reason the UNECE guidelines offer this short list of minimum required activities is an inherent tension in the field of time use research. Time-diary surveys which collect the more detailed activity and context information offer a vast range of research and policy analysis applications; however, even though per range of policy-relevant uses from the individual survey, time use surveys offer particularly good value for money, detailed time diary surveys nonetheless require substantial time and financial cost inputs to administer. The more detailed the diary, the greater the respondent burden. From the early periods of collection, time diary surveys have spanned a range from those collecting substantial detail of activities and those which collect minimal details to address a specific

purpose, and minimise the costs of administering and completing the survey. Some countries only collect one form of time diary, but in many, diaries of a range of detail have been collected at different points in time.

From the outset, Gershuny encountered the challenge of reconciling the limited and detailed coding frames into a single harmonised activity list. Some of the first surveys he harmonised with the Szalai surveys included a 1961 UK and 1964 Danish survey, both of which included substantially fewer activity categories that the Szalai surveys. To limit research only to the detailed coding frames means accepting a more limited range of countries and of time points within countries, which in turn limits the scope of cross-national analysis. From the outset, Gershuny aspired to include as large a field of surveys as the very limited staff resources his teams could devote to the MTUS project.

The early versions of the MTUS included a 41 activity code list based largely on the Szalai activities, but also including some activities of particular relevance at the time in the UK (going to the pub, going to social clubs). In parallel to the 41 categories Gershuny ideally wished he could create, he also developed a 22 category activity list into which nearly all surveys he harmonised could be directly coded. MTUS no longer uses the 22 category list, though details of this category list are set out in Chapter 2.

Since Kimberly Fisher joined the MTUS team in 1999, the MTUS procedures have refined to work with the narrative properties of time diaries and maximise the activity and context information from the diary as a complete narrative, rather than concentrating on parts in isolation. Fisher's concern for data quality and archiving information not only to preserve historical records of developments in the time use research field but also to inform the improvement of future time use survey collection have both expanded the range of uses to which the MTUS can be applied, but also increased the time required to include any individual survey. In order to add more recent surveys and surveys from more countries, the MTUS project has lacked resources needed to upgrade all older surveys each time improvements are introduced to the dataset. As a result, the MTUS expands through a dual process of backwards upgrading of some surveys already included and the acquisition of new data, though a backlog of older conversions will remain for some time.

To meet the divergent interests of the MTUS project team and users, MTUS now offers simple version of the file, which combines the not yet upgraded surveys, some surveys to which the MTUS team at present lacks resources to convert in detail, and a simplified version of those surveys to which considerable efforts at data cleaning and enhancement to create the episode and detailed aggregate files have been invested. The 25 (plus four) activity categories in the simple file

directly collapse from the current 69 activity category typology (and also represent the categories possible to create from a larger range of surveys).

3.1 Using MTUS activity codes

We now detail all three MTUS activity category typologies. This user guide should be read in conjunction with the Coding Procedures Document, which offers a detailed breakdown of the components of each of the activity codes, and with the survey-specific README documents for each survey the user wishes to include in research. The README files offer maps of original survey codes into the MTUS codes.

In the summary aggregate and simple MTUS files, each row represents a 24hour time diary. The aggregate file includes variables for the total minutes in each of the 69 categories, and separately in each of the 41 categories. The simple file includes variables for the total minutes in each of the 25 categories. The total time spent across the 69, 41 and 25 categories sums to 1440 minutes, the total minutes in a 24-hour day.

Users should note that in the Harmonised Aggregate File (HAF), those summary time use variables which cannot be coded for a particular survey are set to -9 to allow users to distinguish true 0s (that is cases where the diarist did not report any time in the activity) from 0s arising where a survey did not separately collect instances of the activity category. Users will need to exclude the -9 missing cases as missing data before they sum MAIN1 to MAIN69, AV1 to AV41 (otherwise they will produce total time that is less than 1440 for many surveys).

In the Harmonised Simple File (HSF), a number greater than 0 means the diarist reported time in that activity. Values of 0 in the time user variables in the simple file can either mean that the diarist did not report time in that activity or that this category cannot be created for this survey. Users should look through Appendix 3 and the individual survey documentation when interpreting their results.

The default value for all time use variables that can be created is 0 in the aggregate and the simple files. People do not undertake every activity which they regularly perform every day. A 0 value is a meaningful report. The diary reflects just 24 hours of activity of each individual. In drawing large-scale random national samples, time diaries reflect the most common behaviour patterns of different groups across a population. Time use surveys reflect the total amount of unpaid work, voluntary work, exercise, travel, care, cultural participation, and the like that takes place on any given day at different times of the year. Time diaries can be

used in conjunction with longer-term participation questions to analyse the behaviour of individuals over longer time periods, and area of significant development in the time use research field (for instance see Gershuny 2012, UNECE 2013). At this time, the MTUS does not include longer term participation questions. Nevertheless, the MTUS is set up to readily facilitate matching MTUS variables back to original surveys to add additional information. MTUS uses the original identifiers, renamed. The documentation for each survey includes the code to make the MTUS conversion, which users can adapt to add variables to MTUS files.

The person-level and household variables as well as the weights are in the aggregate and simple files, as most analysis will occur at the level where each row case is a diary. The episode level file only contains diary information, sex, age and the indentifiers. To map diaries from spouses together, or the diaries from children and their parents together at the episode level (in surveys that collected diaries from more than one person per household), the user will need to map the spouse indentifier (partid) or the parent identifiers (partid1/2) from the HAF to the HEF file.

The full-diary processing procedures MTUS follows mean that MTUS files map details that might be reported in a number of columns in the time diary in all relevant places in the MTUS codes. Many original surveys do not do this. As a result, the activity reports in the MTUS version of the original surveys may appear to differ from results users might obtain from original surveys. For example, an activity like exercising by riding a bicycle might be recorded as exercise by cycling in the activity code, or just as exercise in the activity code and by bicycle in the location and mode of transport codes. In the MTUS files, this instance would be coded as

activity = exercise by cycling (main=44) location = travelling (eloc=8) mode of transport = bicycle (mtrav=4)

The creation of MTUS files also involves a considerable amount of data cleaning and processing, particularly in the case of older surveys, which were produced in the days when the technology for handling large data files was more cumbersome and survey teams tolerated larger volumes of errors and inconsistencies than now is the case. The MTUS team spends up to 5 weeks per survey harmonised into the episode format looking up original information and running algorithms to correct many of the original file errors and inconsistencies (for instance correcting time and episode inconsistencies arising from original data entry people entering time diary pages out of sequence). At the margins, some research results will differ using MTUS versions as opposed to unadjusted original versions of some datasets.

Some research purposes may require a rework of the categories using a different elements of the diary in the episode and aggregate files. If, for instance, a researcher wishes to explore the risk of exposure to insect bites, categories of exposure risk may relate to a combination of time of day, season of the year, location or activities, and sequencing of events (such as whether the diarist engaged in an activity such as personal care that might have enabled them to mitigate the risk of insect bites if they had brought an insect home on their clothing). Similarly, if the researcher has an interest in physical activity, the mode of transport, the duration of activities, and combinations of activities will inform the possible level of intensity of physically active time. No code frame will ideally suit all research purposes. Users are advised to be very familiar with the coding of activities in order to avoid misinterpretations of results.

3.2 MTUS 69 activity and 25 + 4 activity typologies

Table 3.1 summarises the 69 category main activity category list. In the aggregate file, time in each category as a main activity is summed in a separate variable column. In this aggregate file, the variable column MAIN11 contains the total minutes in reported travel as a part of paid work. In the episode file, we use the same 69 categories for both the main activity variable called "main" and the secondary activity. In the variable columns MAIN (69 category main activity) and SEC (secondary activity), the value 11 means that in this episode, the reported activity is time in travel as a part of paid work. These 69 categories constitute an exhaustive activity list.

Table 3.1 also shows the mapping of the 69 categories to the 25 simple file categories. The second column of table 3.1 shows the variable name for each of these 25 variables, followed by a number in (). This number reflects the order in which the diaries appear in the data file. These numbers are not used in the MTUS simple file. Instead, a variable like sleep contains the total minutes recorded in the activity.

The 25 categories also constitute and exhaustive list. Time summed across the 25 categories totals 1440 minutes. Nevertheless, the simple file does cater for some reclassification needs through the use of four extra variables. Two of these extra variables enable a researcher to identify the total amount of time in out of home leisure spent in restaurants, which would facilitate the reclassification of eating time. As eating at work or school both involves a different setting from eating at home and often involves the purchase of food, we separate out this time to enable users to identify eating time that involves a different form of service and self-service provision. Additionally, we mark the total travel time

which is associated with child care, and the amount of computing time dedicated to games. These variables enable the user to subtract time in these extra variables from the category to which they are assigned and either use these categories as an additional 4 categories or to modify another domain by adding the time in that extra variable elsewhere.

MTUS does not overwrite any entries made by the diarist. If a diarist reports an activity, such as child care, while travelling with a child (as reflected by a change of location and a mode of transport), MTUS team leave the report as made. In certain circumstances where the diarist has not recorded a main activity, the MTUS team does use other information in the diary to fill in the partial information that the diarists' reports of their days make available. As explained in Section 1.7 of this document and the MTUS Coding Procedures document, codes constructed by the CTUR team using diary information have separate codes (1, 3, 41, and 62). These four codes are assigned using information in the diary, and not using analysis of diaries produced by other people.

Activity codes		Description
69	simple file variable	
1	Selfcare (3)	imputed personal or household care
2	Sleep (1)	sleep and naps
3	Sleep (1)	imputed sleep
4	Selfcare (3)	wash, dress, care for self
5	Eatdrink (2)	meals at work or school
	Eatatwrk (extra 2)	
6	Eatdrink (2)	meals or snacks in other places
7	Paidwork (4)	paid work - main job (not at home)
8	Paidwork (4)	paid work at home (main, second or other job)
9	Paidwork (4)	second or other job not at home
10	Paidwork (4)	unpaid work to generate household income
11	Paidwork (4)	travel as a part of work
12	Paidwork (4)	work breaks
13	Paidwork (4)	other time at workplace
14	Paidwork (4)	look for work
15	Educatn (5)	regular schooling, education
16	Educatn (5)	homework
17	Educatn (5)	leisure course or other education or training
18	Foodprep (6)	food preparation, cooking
19	Foodprep (6)	set table, wash/put away dishes
20	Cleanetc (7)	cleaning
21	Cleanetc (7)	laundry, ironing, clothing repair

	ন্ত	
22	Maintain (8)	home/vehicle maintenance/improvement, collect fuel
23	Cleanetc (7)	other domestic work
24	Shopserv (9)	purchase goods
25	Shopserv (9)	consume personal care services
26	Shopserv (9)	consume other services
27	Petcare (11)	pet care (other than walk dog)
28	Pkidcare (13)	physical or medical child care
29	Ikidcare (14)	teach child a skill, help with homework
30	Ikidcare (14)	read to, talk or play with child
31	Pkidcare (13)	supervise, accompany, other child care
32	Eldcare (12)	adult care
33	Volorgwk (16)	voluntary work, civic or organisational activity
34	Religion (15)	worship and religious activity
35	Goout (23)	general out-of-home leisure
36	Goout (23)	attend sporting event
37	Goout (23)	cinema, theatre, opera, concert
38	Goout (23)	other public event, venue
39	Goout (23)	restaurant, café, bar, pub
	Restrnt (extra 1)	
40	Goout (23)	party, reception, social event, gambling
41	Goout (23)	imputed time away from home
42	Sportex (19)	general sport or exercise
43	Sportex (19)	walking
44	Sportex (19)	cycling
45	Goout (23)	other out-of-doors recreation
46	Garden (10)	gardening/forage (pick mushrooms), hunt/fish
47	Petcare (11)	walk dogs
48	Leisure (24)	receive or visit friends
49	Leisure (24)	conversation (in person, phone)
50	Leisure (24)	games (social or solitary), other in-home social
51	Leisure (24)	general indoor leisure
52	Leisure (24)	artistic or musical activity
53	Leisure (24)	written correspondence
54	Leisure (24)	knit, crafts or hobbies
55	Leisure (24)	relax, think, do nothing
56	Read (21)	read
57	TVradio (20)	listen to music, ipod, CD, audio book
58	TVradio (20)	listen to radio
59	TVradio (20)	watch TV, DVD, including web streamed content
60	Compint (22)	play computer games
	Compgame (extra 3)	

3 2	

	<u> </u>	
61	Compint (22)	send e-mail, surf internet, programming, computing
62	Travel (18)	no activity, recorded travel mode or change of
		location
63	Commute (17)	travel to or from work
64	Commute (17)	education-related travel
65	Travel (18)	travel for voluntary/civic/religious activity
66	Travel (18)	child/adult care-related travel
	Caretrav (extra 4)	
67	Travel (18)	travel for shopping, personal or household care
68	Travel (18)	travelling for other purposes
69	Missing (25)	no recorded activity

3.3 MTUS original 41 activity typology

Table 3.2 details the original MTUS activity categories. The 69 activity code list both updates and amends some shortcomings of that original classification. Some of the 41 codes grouped categories where few minutes of time were recorded, but the nature of these activities differs markedly (particularly in paid work time and odd jobs, the latter of which spans adult care, pet care, DIY and household management). Retaining these categories enable users to directly test some of the early publications using the older versions of the MTUS.

Activity codes		Description
69 simple file variable		
1	Paidwork (4)	paid work
2	Paidwork (4)	paid work at home
3	Paidwork (4)	paid work, second job
4	Educatn (5)	school, classes
5	Commute (17)	travel to/from work or education
6	Foodprep (6)	cook, wash up
7	Cleanetc (7)	housework
8	Maintain (8)	odd jobs, including maintenance or home and car,
		household management, pet care & adult care
9	Garden (10)	gardening
10	Shopserv (9)	shopping
11	Pkidcare (13)	childcare
12	Travel (18)	domestic travel
13	Selfcare (3)	dress/personal care
14	Shopserv (9)	consume personal services
15	Eatdrink (2)	meals and snacks

	0	
16	Sleep (1)	sleep
17	Travel (18)	free time travel
18	Goout (23)	excursions
19	Sportex (19)	active sports participation
20	Goout (23)	passive sports participation
21	Sportex (19)	walking
22	Religion (15)	religious activities
23	Volorgwk (16)	civic and voluntary activities
24	Goout (23)	cinema or theatre
25	Goout (23)	dances or parties
26	Goout (23)	social clubs
27	Goout (23)	pubs
	Restrnt (extra 1)	
28	Goout (23)	restaurants
	Restrnt (extra 1)	
29	Leisure (24)	visit friends at their homes
30	TVradio (20)	listen to radio
31	TVradio (20)	watch television or video
32	TVradio (20)	listen to records, tapes, CDs
33	Educatn (5)	study, homework
34	Read (21)	read books
35	Read (21)	read papers, magazines
36	Leisure (24)	relax, do nothing
37	Leisure (24)	conversation
38	Leisure (24)	entertain friends at home
39	Leisure (24)	knit, sew
40	Leisure (24)	other leisure
41	Missing (25)	unclassified or missing
-	Petcare (11)	not possible to create from original MTUS codes
-	Eldcare (12)	not possible to create from original MTUS codes
-	Ikidcare (14)	not possible to create from original MTUS codes
-	Compint (22)	not possible to create from original MTUS codes
-	Eatatwrk (extra 2)	not possible to create from original MTUS codes
-	Compgame (extra 3)	not possible to create from original MTUS codes
-	Caretrav (extra 4)	not possible to create from original MTUS codes

Table 3.3 maps the older 41 categories into the 69 category list, and highlights points at which the two code frames differ. The old and new categories do include some differences, and the more detailed list does not simply collapse back to the older less detailed list. That this is the case is a strength, as there are instances where by mapping the two categories together, users can further break down some code into further details.

3.4 Context and episode variables

Some of the MTUS activity codes imply the presence of others, the use of computers, a mode of transport or a location. The MTUS simple and aggregate files include one explicit context variable: SPPART (total minutes spent over the 24 hour diary with the spouse or partner for those diarists who are in a couple). For surveys where who else is present or time with the spouse or partner is not available, we set this variable to -9. If the diarist is not married and does not have a cohabiting partner, we code this variable as -7.

The MTUS episode file includes a wider range of context information as well as the main activity. The use of these other context variables is more complex, and appropriate use depends on the questions researchers ask using the data. For this reason, these variables are offered in the episode file alone. The episode file also includes sex and age, as well as the diary variables and identifier variables. Users should treat this file as a database from which to extract variables to then match back into the aggregate file for analysis. **This section now considers the additional variables which appear only in the episode file.**

CDAY: Calendar day diary kept

The sole diary variable not in the other versions is **CDAY**. This variable takes a value between 1 and 31 where the information has been released, or -9 if the information is not available. This variable appears here partly to allow matching of additional information relevant to specific days (weather conditions, sunrise and sunset on the diary day, whether the diary took place before or after a major event), and partly to allow testing of potential minor variations in activities across months (for instance closer or further away from when most people get paid).

TIME: Duration of activity in minutes

We calculate this variable by subtracting START from END. Many surveys include a variable for the duration of the episode in minutes, though some files include errors in the variable, and in some cases, described in more detail in relation to the activity variables below, the CTUR team modified the definition of an episode. Consequently, while people converting original surveys into MTUS format should double check their calculation for time against the duration variable in the original file and carefully check any inconsistencies, the variable time should be the variable calculated by the converter of the survey.

CLOCKST: Start time on 24-hour clock

This variable represents the time on the 24-hour clock when the episode started. We report this variable as a 4-digit number. The digit(s) prior to the decimal represent the hour; the two digits following the decimal represent the minute.

6.35	(thirty five minute past 6AM)
18.05	(five minutes past 6PM)

We represent midnight as 0.00.

START: Start minute

END: End minute

There are two ways to represent time in the diary episode file: time as reported on the 24-hour clock, and time in terms of the number of minutes which have elapsed since the start of the diary observation period. A 24-hour file contains 1440 minutes - except on those days where an adjustment of an extra minute is added to the day to adjust for minor variations in the actual rotation speed of the Earth around the sun (though users should note that very few diaries are collected on such days, partly as few of such days appear in the sampled periods and partly as few participants have been willing to keep a time diary on New Year's Eve when such adjustments are added.) The addition or absence of the additional 60 seconds makes little difference to population behaviour patterns, so this dataset makes no attempt to account for these adjustments.

All the surveys included in the MTUS cover an observation period of 24 hours (1440 minutes), and all surveys begin at a point on the 24-hour clock where the majority of the observed population was asleep. There is considerable variability about the start-time on the 24-hour clock, both in the sense that the start time of the diaries varies from midnight to 6:00, and that the time when the diarists in different surveys (as well as in the same survey in the case of countries that span multiple time zones) start their diary in relation to Greenwich Mean Time. As people lead their lives in 24-hour cycles, we harmonise the concept of time in

Version 6 by reporting the start and end minutes of the episode in the 1440 minute observation period. The first episode in all diaries has a start value of 1, and the last episode in all diaries has an end value of 1440.

EPNUM: Episode number

This variable is the identifier of the episode. The first episode has a value of 1.

Episode(n+1) = epnum(n)+1. This episode number should be generated after the activity and ancillary variables have been created. As the next page explains, some elements of the MTUS processing can produce different numbers of episodes compared to the original data. The MTUS variable EPNUM needs to reflect the number of episodes in the MTUS version of the file, while also retaining any changes in the activity or context codes in the original file.

MAIN: Main activity (69 category list)

AV: Main activity (41 category list)

These variables mirror the MAIN1 to MAIN69 and AV1 to AV41 variables in Harmonised Aggregate File (HAF). MAIN covers the main activity codes in the 69 category list of categories. AV covers the main activity codes in the original 41 category list of categories. A code of "33" in MAIN means the diarist performed voluntary work or a civic activity in that time slot (and this time would be summed in MAIN33 for the diary day). The labels of the values in the AV and MAIN activity lists appear in the previous two sections.

In cases where only one activity has been recorded, but we can identify missing travel records (the diarist starts in one place and ends up in another place with no recorded travel), we code the secondary activity as imputed travel. For cases where we identify missing eating or drinking (the diarist records working with food (food preparation or set/clear table) but never reports eating or drinking, or the diarist records social activity at an event where other household members classify the activity as eating, if there is no secondary eating, we add eating as a secondary activity.

As already noted in the first section on the preparation of the data on page 2, CTUR has a number of conventions for filling in other instances where the diarist fills in some elements of the diary but not others yet has provided sufficient information to reveal the sequence of her or his activities in the gap. These cases of filling in information may result in additional episodes appearing in MTUS versions of the data that were not apparent in the original release of the data.

Some surveys collected activities in half-hour time slots. Such long observation periods will include multiple episodes on occasion. In particular, short travel episodes can be left out of the half hour slots. In the case of missing short travel in these 30-minute time slot surveys, as well as in cases where the diarist coded one activity as the main activity and travel as the secondary activity, we code 20 minutes of the 30 minute slot as the main activity, and 10 minutes as travel. The placement of the 10 minutes of travel depends on the sequence in which the time slot occurs. If a diarist has been working at the office for 7 hours, then has a time slot with missing or secondary travel where the main activity is recorded as paid work, then in the next episode is doing activities at home, we code the first 20 minutes of the episode that includes travel and the last 10 minutes as secondary travel. In contrast, if after seven hours of paid work, the diarist then records an episode of eating at a restaurant with secondary travel, and the next time slot is a continuation of eating out, then we code the first ten minutes of the time slot with the short travel episode imbedded as travel and the second 20 minutes as eating out in the restaurant.

This procedure increases the number of episodes in the MTUS version of the data as compared to the original data. For this reason, the episode number and start and stop minute of episodes need to be calculated after the activity and ancillary variables have been constructed.

SEC: Secondary activity (69 category list)

Simultaneous activities do not sum to 1440, nor should the user attempt to do so. While people may undertake more than one activity at the same time (such as driving while listening to the radio), the surveys harmonised here have highly variant instructions about the degree of detail respondents should try to capture in the recording of secondary activities. Also, the degree of commitment implied by different combinations of activities is not the same. Consider the difference between watching the waves while sunbathing on a beach, watching the children while making dinner, and looking after an adult with dementia while watching television. The first activity combines forms of leisure, the second combines care and domestic work and the third combines care and leisure. In many research contexts, the first of these combinations might be treated as a single activity. The same is not the case for the second two examples.

Researchers using time use data should consider the nature of their analytic needs in deciding whether and how to include secondary activities. In some cases, some combinations of simultaneous activities will count as new activities added to the instances of singular or focussed activity, and the total time spent in

the day across this expanded and customised list of activities should total 1440 minutes. Which secondary activity combinations are relevant will vary by the focus of the research. We code the secondary activities using the 69 category list also used to code main activities.

In some diary surveys, diarists were able to report more than one secondary activity. Where this occurs (UK 1987), we split the episode into sub-episodes that total to the same length of the original episode, one new episode for each reported secondary activity. In these cases, we coded the main activity and context information as applying across all elements of the split episode, except where there is a clear transition to travel. Users can identify these cases as these sub episodes have the same value for the variable clockst, while all unsplit episodes have different values for clockst (the start time of the episode on the clock).

ELOC: Location

able 3.4: Location codes				
Location variables	Description			
INOUT = -8	location unknown			
INOUT = 1	Inside			
INOUT = 2	outside			
INOUT = 3	travelling			
ELOC = -8	location unknown			
ELOC = 1	at own home			
ELOC = 2	at another's home			
ELOC = 3	at workplace			
ELOC = 4	at school			
ELOC = 5	at services or shops			
ELOC = 6	at restaurant, café, bar, pub			
ELOC = 7	at place of worship			
ELOC = 8	travelling			
ELOC = 9	other locations			

Table 3.4: Location codes

Table 3.4 details the location codes. We draw these location codes both from separate location variables and from imbedded information in the original activity codes. Users should note that the degree of specification about whether an activity in inside or outside is highly variable by survey, and caution should be used with this variable for cross-country and cross-time analysis. During this process, we have checked any inconsistencies between the original location

codes and the imbedded activity codes, and we comment on such cases in the conversion programmes for each survey. Where some location codes we aim to identify are collapsed into a general "other" code, where possible we use the activity codes to break down "other" locations. As examples, if there is no code for school, but the activity is formal schooling and takes place away from home, we code the location as school. Similarly, if the activity is attend religious service and the location is other not at home, we code this activity as at a place of worship. If the diarist was travelling (including on foot and by bicycle), ELOC has the value of 8.

ICT: Used information communication technology during activity

We include a marker of whether the diarist used one or more ICTs during the activity. In some recent surveys, the diary included a column marking whether the diarist used ICTs. If such a column is available, then we use this column to create this 0/1 marker variable. In many cases, however, we can only identify this information from the activity code list. The HETUS surveys, for example, separately coded playing social games from playing social computer games, and doing household accounts and banking on the computer/over the internet from doing household accounts and banking on paper. In cases where the identification of ICT use is available in more than one format (a dedicated column as well as in activity codes), we use all forms of available information to create this marker. As is the case with the mode of transport, where the diarist may not write down the word "commute" in the activity column if they have written "drove car to work" in the location column, some diarists similarly might write "internet banking" as their activity but not bother to tick the used a computer box. Nevertheless, such an identification of the activity does give use sufficient information to know that the diarist used ICTs during this episode.

ICT values	Description
ICT = 0	no/not known if computer, mobile, web used
ICT = 1	computer, mobile phone, web used

MTRAV: Mode of transport

Most surveys that collect mode of transport gather this information in a separate column, but in some cases the mode of transport is recorded in the activity codes. Again, we use any available information in the data to code MTRAV (categories shown in Table 3.5). For those cases where we identify unrecorded travel, we record the mode of transport as travel by unspecified means.

Table 3.5: Mode of transportation codes

V	
MTRAV values	Description
MTRAV = -8	activity missing
MTRAV = -7	not travelling
MTRAV = 1	travel in car/truck, on motorcycle (inc. taxi)
MTRAV = 2	travel on public transport
MTRAV = 3	walk / on foot
MTRAV = 4	cycle, other physically active transport
MTRAV = 5	travel by other/unspecified transport

Where the original survey records an activity such as walking for pleasure, jogging or hiking and no mode of transport is recorded, we code MTRAV as walk / on foot. Where the activity is coded as a sport that also involves physical active travel (cycling, riding a horse etc.) and no mode of transport is recorded, we code MTRAV cycle or other active transport.

ALONE: Alone or with strangers

CHILD: Child aged <18 present

SPPART: Spouse or partner present

OAD: Other adult present

Collection of the who else is present data varies more across the surveys than other information harmonised into the MTUS. Creating a useful single "who else was present" variable for a majority of surveys is almost impossible. Instead, we opted to make four flags. As with the other ancillary information, these flag variables are based on a combination of who else is present column information as well as activity codes (and any other relevant information in the diary). Some diary surveys have code frames that mark the presence of others in certain activities. A code for "physical care of children" implies that at least one child is present to receive this care. "Watch TV alone" similarly would indicate that other people are not present.

The concept "alone" does not necessarily mean that no other person was within sight of the diarist. If given the option of "alone" in a who else is present matrix, some diarists will select "alone" when on public transport at rush hour, while eating out in a restaurant or shopping for essential goods. In such cases, the diarist most likely is around other people, and the "alone" designation means that the diarist is not engaging with these other people, though the diarist may well moderate her or his behaviour on account of the presence of these other people.

The "alone" flag marks cases where the diarist had an option on the survey instrument to indicate that he or she was alone and selected this option.

Most surveys do not ask diarists to count the exact number of other people present. The American Time Use Study includes the most detailed code frame for the presence of others, and even this list allows an unspecified number of certain categories of people to be covered by a single value. Users need to be aware that the presence of children or other adults will not necessarily allow them to identify which children or other adults were present, only that children or other adults were present.

In the case of the presence of children, the MTUS does not distinguish household children from non-household children, or the diarists' own children from other children. Some original surveys do make such distinctions. In the MTUS case, the flag that a child was present simply means at least one person aged <18 was with the diarist.

Where the diarist is in a couple and the "who else is present" column allows us to distinguish if the spouse or partner was present, we mark this in the spouse column. Some surveys do not distinguish the presence of the spouse from the presence of other household adults. In these cases, we code the presence of the spouse for those cases where we can make this determination. In households comprised only of a couple or of a couple and children, the presence of another household adult necessarily means the presence of the spouse. We comment on this matter in the individual survey documentation and readme files. For such surveys, the presence of the spouse cannot be identified where the household includes more than one couple or a couple and other adults.

The OAD variable covers the presence of any other adult – this includes the presence of the spouse/partner. SPPART and OAD are not mutually exclusive as this allows us to make a maximally relevant code for the surveys harmonised into the MTUS. Users can make more detailed distinctions with some original datasets, though not with others.

Who else present	Description			
variables				
ALONE = 0	others reported present			
ALONE = 1	no others reported present			
CHILD = 0	child not reported present			
CHILD = 1	with child			
SPPART = 0	spouse/partner not reported present			

 Table 3.6: Who else was present codes

SPPART = 1	with spouse/partner	
OAD = 0	other adults not reported present	
OAD = 1	with other adults	

3.5 Cross-survey comparability

The extent to which it was possible to create the harmonised codes is partly a function of the number of codes originally used in each survey. Table 3.7 provides further information on these codes.

Table 3.7: Information on the codes of activities used in each survey (prio	r
to harmonization)

Notes:

* Based on the merged 1975 to 1995 file provided by the Netherlands. This merged file contains identical codes across the 5 surveys. The codes for each individual survey may have differed prior to this harmonization.

CHAPTER 4: DIARY, DEMOGRAPHIC AND SOCIO-ECONOMIC VARIABLES

The MTUS contains identifiers (equal to the original survey identifiers wherever possible), as well as harmonised diary, demographic and socio-economic variables. Most original datasets contain a larger number of such variables. In the context of MTUS, we prioritise variables available in a large majority datasets. This section lists the categories of the harmonised variables. Details of the specific conversions appear in the survey-specific (readme) documents.

The harmonised variables cluster into the following five sets:

- Diary, survey and case information
- Household-level variables
- Person-level demographic variables
- Employment and education
- Health

Some background variables are not included in all versions of all files. The table shows which variables are in which MTUS versions. We present the variables in the order in which they should appear in the final files in both the table and the subsequent variable descriptions.

Variable	Episode File	Aggregate File	Simple File
Country – country of survey	included	included	included
Survey - survey start year	included	included	included
Swave - wave if longitudinal	included	included	included
Msamp - multi-sample marker	included	included	included
Hldid - household identifier	included	included	included
Persid - person identifier	included	included	included

Ethiopia	ET	New Zealand	NZ	United Kingdom	UK
Finland	FI	Norway	NO	United States	US
France	FR	Oman	OM	Uruguay	UY
Germany	DE	Pakistan	PK	Yugoslavia	YU
Ghana	GH	Palestine	PS		
Greece	GR	Peru	PE		

These country codes are based on the International Organisation for Standardisation (ISO) 3166-1 alpha-2 typology. Users should note three derivations. The official designation for the United Kingdom is GB, but UK is reserved for use by the UK. As the MTUS documents already used UK, we deemed changing to GB an inefficient use of our labour, hence UK remains. The YU for Yugoslavia was deleted from the original ISO 3166-1 but remains reserved transitionally for Yugoslavia. As the survey from Yugoslavia has elements in two newer countries, both of which have data in the MTUS, we retain this designation for this older survey. CZ now applies only to the Czech Republic. The Czechoslovakian surveys are old, and neither the Czech Republic nor Slovakia have recent time use surveys. Information taken from this website: https://en.wikipedia.org/wiki/ISO_3166-1_alpha-2#Exceptional_reservations

Surveys collected in what were East and West Germany, and the Slovenian and Serbian elements of the 1965 Yugoslavia Szalai survey can be distinguished using the variable MSAMP.

SURVEY: Year the survey began - HEF HAF HSF

This variable records the 4-digit year in which data collection began

SWAVE: Longitudinal study wave marker - HEF HAF only

This variable is relevant only for surveys that are longitudinal.

Value	Label	
0	Not longitudinal	
1	Wave 1	
2	Wave 2	
3	Wave 3	
4	Wave 4	

Note that in the case of Denmark 1987/2001 (with multiple samples), the code '1' in 1987 and 2 in 2001 indicates a longitudinal case, while the code '0' indicates that that it is not a longitudinal case.

MSAMP: Multiple samples using the same diary instrument - HEF HAF HSF

4	USA 2000-01
5	Slovenia in Szalai Yugoslavia
6	Serbia in Szalai Yugoslavia
7	UK 1987 - main sample, drawn
	from SCELI survey
8	UK 1987 - spouses and
	additional household members
9	East Germany
10	West Germany
11	Basque Country in Spain

HLDID: Household identifier - HEF HAF HSF

This variable uniquely identifies households for those studies where more than one household member completed a diary. For surveys in which only one person per household completed a diary and no household identifier is included in the original data, HLDID=0. For surveys in which only one person per household completed a diary but a household identifier is included, HLDID takes the original value for the corresponding variable. If the household identifier should be combined with a higher level identifier, such as sampling region, then the value of HLDID should combine the larger group identifier and the household identifier so that each HLDID uniquely identifies one household.

In some limited cases, the original survey data does not include a household identifier even though the study collected a diary from more than one person in the household. In these cases, we construct a household identifier using a combination of other variables that enable us to make a unique identification (full details of these cases are explained in the survey conversion files where this was needed).

If the household identifier maps to other data but is not relevant to the time use survey or if the household identifier needs to be computed or adjusted in any way, an explanatory note should be included in the Readme documentation file. The household identifier should enable users to match MTUS data back to the original survey.

PERSID: Person/diarist identifier - HEF HAF HSF

This variable uniquely identifies diarists within sampled households. For surveys with only one diarist per household, this identifier should uniquely identify each diarist. Use the original person-level identifier to allow users to match back to the original data. If no identifier was included with the data, construct an identifier from a combination of person and household-level variables that allows the unique identification of diarists.

ID: Diary identifier - HEF HAF HSF

This variable uniquely identifies each diary kept by each diarist. Normally, if the survey collected three diaries per participant, ID would have values between 1 and 3. Keep the original diary identifier if there is one to allow users to match MTUS data back to the original data. If the survey collected only one diary per diarist, ID should = 1.

PARNTID1: Person identifier of 1st parent of diarist - HEF HAF only

This variable records the person-level identifier of the first parent of the diarist if that parent also completed a diary or otherwise has person-level information included in the original survey. In cases where only one person per household completed a diary and no other information is available about household members, this variable is coded as -9. If multiple people completed diaries in the household and the diarist does not live with a parent, this variable takes a value of -7. If the diarist lives with a parent and this parent should have but did not complete a diary or cannot be identified, this variable takes a value of -8. If both parents are in the same household and completed diaries, this variable takes the value of the parent with the lower person identifier.

PARNTID2: Person identifier of 2nd parent of diarist - HEF HAF only

This variable records the person-level identifier of the second parent of the diarist if the parent also completed a diary or otherwise has person-level information included in the original survey. In cases where only one person per household completed a diary and no other information is available about other household members, this variable is coded as -9. If multiple people completed diaries in the household and the diarist does not live with a parent or only lives with one parent, this variable takes a value of -7. If the diarist lives with two parents and both parents should have but did not complete a diary or cannot be identified, this variable takes a value of -8. If both parents are in the same household and

completed diaries or have other person-specific information in the original survey, this variable takes the value of the parent with the higher person identifier.

PARTID: Person identifier of spouse or partner - HEF HAF only

This variable records the person-level identifier of the spouse or partner of the diarist if the spouse or partner also completed a diary or has other person-level information in the original survey. In cases where only one person per household completed a diary and other information is not available about other household members, this variable is coded as -9. If multiple people completed diaries in the household and the diarist does not have a spouse or partner, this variable takes a value of -7. If the diarist has a partner who cannot be identified, this variable takes a value of -8.

DAY: Day of week diary kept - HEF HAF HSF

This variable records the day of the week when the diary was kept. Note that some older surveys only included all week averages or distinguished Saturdays and Sundays from week days, but did not distinguish week days.

Value	Label
1	Sunday
2	Monday
3	Tuesday
4	Wednesday
5	Thursday
6	Friday
7	Saturday
8	Averaged time across week
9	Unspecified weekday
10	Unspecified weekend day

CDAY: Calendar day diary kept - HEF only

The sole variable not in the other versions is **CDAY**. This variable takes a value between 1 and 31 where the information has been released, or -9 if the information is not available. This variable appears here partly to allow matching of additional information relevant to specific days (weather conditions, sunrise

and sunset on the diary day, whether the diary took place before or after a major event), and partly to allow testing of potential minor variations in activities across months (for instance closer or further away from when most people get paid).

MONTH: Month diary kept - HEF HAF HSF

This variable records the month when the diary was kept. Some surveys only record the quarter or season when the survey was carried out. In such cases, we assumed that the survey was conducted during the first month of the quarter even though the data collection was actually spread throughout the quarter. Such cases are documented in the relevant Readme documents.

Value	Label

2	February
3	March
4	April
5	May
6	June
7	July
8	August
9	September
10	October
11	November
12	December

YEAR: Year diary kept - HEF HAF HSF

This variable records the year when the diary was kept in four digits.

DIARY: Diary order - HEF HAF only

When surveys collected more than one diary per person, this variable records the order in which diaries were completed. In most cases, this variable has the same value as ID, the diary identifier. In a limited number of surveys, the UK 2000-01 and France 2009-10, a minority of diaries have a diary identifier order that differs from the date order in which diaries were completed. In both cases, this coding variation reflects coding mistakes. We use the variable DIARY to mark the order of completion rather than correcting the variable ID so that users are able to smoothly match MTUS data back to the original survey data. Where users wish

to control for or examine effects of completing multiple diaries, users will need to use this variable instead of ID. For surveys that collected only one diary per participant, this variable takes the value 1.

Value	Label
1	First diary day
2	Second diary day
3	Third diary day
4	Fourth diary day
5	Fifth diary day
6	Sixth diary day
7	Seventh diary day

BADCASE: Marker of low-quality cases - HEF HAF only

This variable distinguishes good quality diaries from various categories of lowquality diaries. We define good quality diaries as those which:

- (a) have valid values for day of the week the diary was kept as well as a significant proportion of basic background variables about the diarist, including age and sex;
- (b) have no more than 90 minutes missing time per 24-hour diary (calculated after diary processing, filling in gaps in main activity with information recorded in other sections of the diary;
- (c) have at least 7 episodes per 24 hours (defined from the original sequence data as a change in main activity, secondary activity; location or any other dimension of the diary);
- (d) have at least 3 of the 4 basic activities described in Section 5 above which most people undertake at least once per day (with exceptions for people who recorded care of adults, children or pets on their diary day but otherwise have a good quality diary, as well as cases of people who record sequences where we have some idea where missing basic activities took place. The four basic activities include: sleep and rest; eating and drinking; self care; and travel or exercise.

Value	BADCASE Labels
0	Good quality diary
1	Missing age or sex of diarist only
2	Missing day of week diary completed only
3	Missing 91+ minutes only
4	Fewer than 7 episodes only

5	Missing 2-4 of four basic activities
6	Missing diarist's age or sex and day of the week
7	Missing diarist's age or sex and 91+ minutes
8	Missing diarist's age or sex and <7 episodes
9	Missing diarist's age or sex and 2+ basic activities
10	Missing day of week and 91+ minutes
11	Missing day of week and <7 episodes
12	Missing day of week and 2+ basic activities
13	Missing 91+ minutes and <7 episodes
14	Missing 91+ minutes and 2+ basic activities
15	<7 episodes and missing 2+ basic activities
16	Missing age/sex, day of week, & 91+ minutes
17	Missing age/sex, day of week & <7 episodes
18	Missing age/sex, day of week, & 2+ basic acts
19	Missing age/sex, 91+ minutes & <7 episodes
20	Missing age/sex & 91+ minutes and 2+ basic acts
21	Missing age/sex & 2+ basic acts, <7 episodes
22	Missing day of week, 91+ minutes & <7 episodes
23	Missing day of week, 91+ minutes & 2+ basic acts
24	Missing day of week <7 episodes & 2+ basic acts
25	Missing 91+ minutes & 2+ basic acts, <7 episodes
26	Missing age/sex, day of week, 91+ minutes, & <7 episodes
27	Missing age/sex, day of week, 91+ minutes, & 2+ basic acts
28	Missing age/sex, day of week, 2+ basic acts & <7 episodes
29	Missing age/sex, 91+ minutes, <7 episodes, & 2+ basic acts
30	Missing day of week, 91+ minutes, <7 episodes, & 2+ basic acts
31	Low quality on all five measures

- HHTYPE
- HHLDSIZENCHILD

AGEKIDX

- AGEKID2
- INCORIG
 - INCOME
 - OWNHOME
- URBAN
- COMPUTER
- VEHICLE

HHTYPE: Household type - HAF only

This variable records the type of household in which the diarist lived at the time of the survey. This variable is computed from a household type variable or a household grid when available, and from a combination of marital status and household size when no household type classification was available. Where there is inconsistency in the reporting in the survey, the converter should opt for the most logical solution and document the process of coding this variable in the code file.

One person households have only 1 member. In instances where a household size variable suggests that there is only one household member, but the person is also a parent and not in a couple and at least one child also lives in the household, then the household type should be coded as 4.

Values 2 and 3 mark instances where a household includes a couple (cohabiting or married). If the couple are the only people in the household (and the household size=2, then the appropriate code is category 2. If a couple lives in the household with at least one other person, then the code is 3. It does not matter if the couple are lodgers of the household reference person, or the household is a multi-couple household, or the reference person is a widow/widower or divorced person and has a child who has a partner that lives in the same household, or is a couple and children, the appropriate code is 3. If two or more people live in the household, and no household member is in a couple, then the appropriate code is 4. A crosstab of civstat and hhtype should produce no cases of a person with civstat=1 (in couple) and hhtype=4.

Value	Label
1	One person household
2	Couple alone
3	Couple + others
4	Other household types

In some surveys, we cannot identify cohabiting couples, and these people may be miscoded as HHTYPE =4. Some surveys make the identification of single parent households difficult. If there are potential miscodes in this variable, these should be noted in the documentation.

In contrast to FAMSTAT, this variable is a household characteristic and all household members should be coded the same way.

HHLDSIZE: Number of people in household - HAF HSF only

This variable records the total number of household members. In some surveys, the size of large households is capped, with the value 'n' meaning 'n or more members'. Such cases should be documented in the Readme documents.

There are cases where household size is not presented directly or in full. In such cases, we made the best possible calculation based on what information is available (summing number of income earners + non-income earners, number of people listed on the household matrix, 2 + the number of children for couple households with children, etc.). Any instances where this information is incomplete for a survey should be documented in the Readme file for the survey.

General notes on 3 household child variables

If a household member is a dependent child, someone will have a legal responsibility for looking after that child, and the presence of the child in the household will likely have some impact on the behaviour of other household members (if only in influencing the storage of chemicals, use of language, some late night leisure activity choices, or timing of some forms of housework). NCHILD values 1 and higher, AGEKIDX values 1, 2, & 3, and AGEKID2 values 0 through 17 indicate that a child of this age lives in the household. The relationship of the child to the other household members does not matter. In some cases, a child may also be the household reference person. If a 17-year-old lives alone or a 16 and 17-year-old married couple live alone together, the NCHILD, AGEKIDX and AGEKID2 should have values in the child present range.

When we look at the time use patterns of adults, there are some altered social expectations when the relationship between two adults is that of parent and child. We also mark these relationships in the value of AGEKIDX=4 and values of 18 and greater for AGEKID2. AGEKIDX=4 and AGEKID2>17 apply only when the

relationship between two people in the household is that of parent and child and no person aged 17 or younger lives in the household. If no people aged less than 18 live in the household and no household member is the child of another household member, then the appropriate codes are: NCHILD=0; AGEKIDX and AGEKID2= -7.

NCHILD: Number of children under 18 in household - HAF HSF only

This variable records the total number of children aged under 18 in the household. The children are not necessarily the diarist's own children. If the diarist is aged <18, nchild should be >0, even if the diarist is married.

This variable is highly comparable across countries, though there are some surveys with limited information about household composition and different age bands (such as the number of children aged <15 or <12). We made adjustments and corrections when possible. Users are asked to consult the Readme documents for more detailed explanations.

AGEKIDX: Age of youngest child in household (including adult children) -HAF HSF only

This variable records grouped information on the age of the youngest child in the household. If no household member is the child of another household member and all members are aged 18 or older, this variable takes the value -7.

Value	Label
1	Youngest child aged between 0-4
2	Youngest child aged between 5-12
3	Youngest child aged between 13-17
4	Youngest child aged 18+

If the survey has different cut-off points in categories of age of the youngest child, or only report information on the diarist's children rather than children residing in the diarist's household, a note should be recorded in the Readme document.

AGEKID2: Age of youngest child in household - HAF only

This variable records the actual age of the youngest child in the household. If a household member is aged less than 18, then this variable has a positive value

(unless the exact age is not known). If no household member is aged less than 18 and no household member is the child of another household member, this variable takes the value -7. In the unlikely event that a child in the household is aged older than 60, the age should be top-coded at 60 - that is the value 60 means 60 or older.

INCORIG: Original household income - **HAF** only

This variable records total household income as originally recorded in the survey. This variable is **not harmonised** (see INCOME for the harmonised variable). This variable is not suitable for analysis across the megafile, but is provided to enable users to make customised variables for individual research projects.

Note that when merging data from different surveys, the original value labels for this variable will be lost since they are survey-specific. Labels are recorded in the Readme document for each survey.

INCOME: Total household income - grouped - HAF HSF only

This variable records the annual household income, recoded in quartiles.

Value	Label
1	lowest 25%
2	middle 50%
3	highest 25%

Income often has a high percentage of cases with missing values. Also, in many surveys, data on household income was collected and/or coded in income groups rather than interval values. As a result, the identification of the cut-off points for the first quartile (lowest 25%) and fourth quartile (highest 25%) may not be precise.

OWNHOME: Whether household owns or rents home - HAF only

This variable marks whether a diarist's household owns or rents accommodation.

Value	Label
1	Own (outright or on mortgage)
2	Rent
3	Other arrangement

URBAN: Urban or rural household - HAF HSF only

This variable indicates whether or not the diarist lives in an urban area.

Value	Label
1	Urban/suburban
2	Rural/semi-rural

Survey-specific definition of 'urban' and 'rural' is included in the conversion code. Look up the official statistical office definition of rural areas where the available data indicate the population of the area in which the diarist resides.

COMPUTER: Does household have a computer - HAF only

This variable indicates whether the diarist's household has a home computer and / or internet access at home.

Value	Label
0	No
1	Yes

VEHICLE: Does household have a private vehicle - HAF only

This variable reflects the private transport options of the diarist's household. In most developed countries, the question of access to animal is not asked. In urban areas of many developed countries, transport by animal may not be permitted. Most people in most developed countries can afford to purchase a

bicycle and are able to ride that bicycle if they chose to do so. Most surveys ask whether the household has a car or the number of cars the household owns. A smaller number of surveys ask whether the household owns a bicycle. Often the number of cars and ownership of a bicycle are separate questions. Unless noted in the documentation to the contrary, for most developed countries only options 0, 3 and 4 will apply. Options 1 and 2 are for those countries where such data are collected, generally also where the affordability of any private transport option is not accessible to all households.

Value	Label
0	No
1	Animal only
2	Non-motorised vehicle
3	1 car or motorcycle
4	2+ cars or motorcycles

4.3 Person-level demographic variables

- SEX
 - AGE

- SINGPARRELREFP
- COHAB
- CITIZEN

- FAMSTAT
- CIVSTAT

SEX: Sex - HEF HAF HSF

Value	Label
1	Man
2	Woman

AGE: Age - HEF HAF HSF

This variable records the age of respondents (2 digits). For surveys in which age was recorded in categories, we recoded age into a continuous variable by assigning the mid-point of each age group (e.g. 17 for age group 15-19). When surveys only included the year of birth of respondents, we computed AGE by subtracting the year of birth from the year of the survey. The protect the anonymity of the oldest diarists, we top-code age at 90 – that is the value 90 means aged 90 or older.

FAMSTAT: Individual level family status - HAF only

This variable is an individual characteristic, which means that not every member of a household would be coded the same way (in the case of multi-member surveys). It records the presence of any children in the household (irrespective of whether those children are the diarist's own children), and the diarist's age.

Value	Label
0	Adult aged 18 to 39 with no co-resident children <18
1	Adult 18+ living with 1+ co-resident children aged <5
2	Adult 18+ living with 1+ co-resident children 5-17, none <5
3	Adult aged 40+ with no co-resident children <18
4	Respondent aged <18 and living with parent(s)/guardian(s)
5	Respondent aged <18, living arrangement other or unknown

SINGPAR: Whether diarist is a single parent - HAF only

This variable records whether the diarist is a sole parent living with her or his child or children.

Value	Label
0	No
1	Yes

RELREFP: Relation to household reference person - HAF only

This variable indicates the relationship of the diarist to the household reference person. In the MTUS, the reference person usually is the person who answered the household questionnaire (generally person identifier 1). In some cases, this may be the person the survey designates as the head of the household.

Value	Label
1	Person 1
2	Spouse/ Common-law partner
3	Child
4	Parent
5	Sibling
6	Son/Daughter-in-law
7	Father/Mother-in-law
8	Brother/Sister-in-law
9	Other Relative
10	Not related

CIVSTAT: Is diarist in a couple? - HAF HSF only

This variable marks whether the diarists is in a couple.

Value	Label
1	Yes, diarist is in a couple, lives with spouse/partner
2	No, diarist not in a couple

COHAB: Respondent is cohabiting - HAF only

This variable indicates whether or not the diarist is cohabiting or legally married. People not in couples are coded as -7.

Value	Label
-7	Not in a couple
0	Married/civil partnership
1	Cohabiting

CITIZEN: Whether diarist is a citizen of the country - HAF only

This variable indicates whether or not the diarist is citizen or national of the country in which she or he completed the diary.

Value	Label
0	No
1	Yes

4.4 Employment and education variables

- EMPSTAT
- EMP
- UNEMP
- STUDENT
- RETIRED

- EMPSP
- WORKHRS
- EMPINCLM
- OCCUPO
- ISCO1

- SECTOR
- EDUCA
- EDCAT
- EMPSTAT: Employment status HAF HSF only

This variable reflects attachment to the labour market. People who are retired, students, seeking work or looking after family but who work at least some hours should be coded as working part time. Category 4 should mean no attachment to the labour force, though when it is not possible to make this distinction, this fact is noted in the Readme file for the survey.

Value	Value Label	Description
1	Employed Full	Employed/self-employed (including
	Time	military service), full-time hours
2	Employed Part	Employed/self-employed (including
	Time	military service), part-time hours
3	Employed,	Employed/self-employed (including
	unknown status	military service), hours of work
		unknown
4	Not in paid work	Other
		Unemployed, looking for work
		Retired
		Homemaker
		Currently attending school
		Currently on maternity leave
		Disability retirement/leave

EMP: In paid work - HAF only

This variable indicates whether or not the diarist was employed or self-employed (i.e. had a paid job) during the week prior to the survey (or whatever the period of reference was in the original questionnaire). The value 1 here means the diarist should have a value between 1 and 3 for EMPSTAT.

Value	Label	
0	Not in paid work	
1	In paid work	

UNEMP: Unemployed - HAF only

This variable indicates whether or not the diarist was unemployed during the week prior to the survey (or whatever the period of reference was in the original questionnaire). This variable does not differentiate between respondents who were registered as unemployed, who were not working but available for work and actively seeking work, and who self-reported themselves to be unemployed. Ideally, when combined with EMPSTAT, this variable should distinguish unemployed people not undertaking any paid work from those with some part-time or unknown hours work time.

Value	Label	
0	Not-unemployed	
1	Unemployed	

STUDENT: Whether diarist is a student - HAF only

This variable indicates whether or not the diarist was a student. This variable should be coded from a question about whether or not the diarist was a student (or was enrolled in school). Where no information on whether the diarist is a student is available, but the diarist is in the age range where children are required to attend school in the country where the survey was collected, if any study activity is coded in any of the diaries from this respondent or the diary is completed during school holidays, we code this diarist as a student. When combined with EMPSTAT, this variable should distinguish working and non-working students.

Value	Label	
0	Not a student	
1	Student	

Some surveys only identify students whose general economic activity status is study. In such surveys, students may be miscoded if the survey took place during summer months. For example, a student who is working full-time during summer

months and is interviewed during such a month would declare his/her main activity during the week prior to the survey as 'employed' as opposed to 'student'. Cases where a general economic activity status variable is the only way to identify students should be noted in the Readme documentation file.

RETIRED: Whether diarist has retired - **HAF only**

This variable indicates whether or not the diarist has retired. This variable should be created from a question about retirement. If the study did not include retirement questions, the receipt of a retirement pension income can be used instead. Where no information is reported, but the diarist is aged above the legal retirement age and does not report working full-time hours, we code this perso as retired. Only when this information was not available was data regarding the diarist's main activity during the week prior to the survey used to compute this variable. Ideally, when combined with EMPSTAT, this variable should distinguish working and non-working retired people. The Readme documentation file should not when the retirement variable only can be created from a main economic activity status last week variable.

Value	Label	
0	Not retired	
1	Retired	

EMPSP: Employment status of spouse/partner - HAF only

This variable records the employment status of the diarist's spouse or partner for diarists who are in couples. Where the survey collected diaries from both people in the couple, each partner's own self-reported employment status should be used to identify the corresponding spouse's employment status. Where one partner's employment status is not reported or where only one person in the household completed a diary, we use questions about the employment status of the diarist's spouse during the week prior to the survey (or whatever the period of reference was in the original questionnaire).

Note that if the diarist is not in a couple (CIVSTAT=2), EMPSP is coded as '-7'.

Value	Label	
1	Employed full-time	
2	Employed part-time	
3	Employed, unknown hours	
4	Not in paid work	

WORKHRS: Paid work hours last week including overtime - HAF HSF only

This variable records the number of hours of paid work reported during the week prior to the survey including any overtime. Note that the number of hours of paid work during the last week was given priority even if data on the number of hours 'usually worked' was available. If data on the number of paid work hours last week was not available, then WORKHRS was computed by using usual hours of paid work. When neither question was available, 7-day diaries or work schedules (as collected in HETUS surveys) were used to measure hours worked during the diary week. Surveys in which this variable does not represent hours worked last week should be documented in the Readme documents. The variable includes reported hours of paid work for any diarist who answered the question, whether or not this person reports being employed on a main economic activity variable.

Value of 0 means that the diarist reported zero hours of paid work. If diarists were not asked the question, they were given a value of -9 or -7 as appropriate. If diarists did not answer the question, they were coded as -8 for this variable.

EMPINCLM: Original monthly employment income - HAF HSF only

This variable records the monthly personal income from wages/employment/selfemployment during the last month. This variable is not harmonised and is instead recorded in national currency. Note that if data is only available on the personal income from wages/employment/self-employment during the last 12 months, include this variable as presented and add a note the Readme file.

Note that when merging data from different surveys, the original value labels for this variable will be lost since they are survey-specific. Labels should be recorded in the Readme document.

OCCUPO: Original occupation - HAF only

This variable details the diarist's occupation. If the diarist is employed at the time of the survey, use the diarist's current occupation. If the diarist is not presently employed, but there is information on the diarist's most recent occupation, use this information to code occupation. Aim to use an ISCO 2008 compatible variable if this is available, otherwise use the closest approximation. Ensure that you enter the original value labels associated with each value in the survey documentation. If you need to combine multiple variables to make a single

variable, ensure all the original elements have a separate label in the new combined variable.

ISCO1: ISCO 2008 1-Digit Occupation - HAF only

This variable uses the first digit of ISCO 2008 code for occupation groups. If a respondent's occupation is not given in ISCO categories, make the best approximation of these categories that can be made from OCCUPO and note the variations in the survey documentation. As with OCCUPO, if the diarist is presently employed, use the current occupation to make this variable. If the diarist is not currently employed but a last occupation variable is available, use this last occupation variable to make ISCO1.

Armed Forces occupations	0
Managers, senior officials and legislators	1
Professionals	2
Technicians and associate professionals	3
Clerical workers	4
Service and sales workers	5
Skilled agricultural, fishery, and forestry workers	6
Craft and related trades workers	7
Plant and machine operators and assemblers	8
Elementary occupations	9

SECTOR: Sector of employment - HAF only

This variable records if employed people work in the public or the private sector.

Value	Label	
1	Public sector	
2	Private sector	

EDUCA: Educational level-original study code - HAF only

This variable contains the diarists' education level as originally coded in the surveys. This variable is not harmonised. Note that when merging data from different surveys, the original value labels for this variable will be lost since they are survey-specific. Labels should be recorded in the Readme document. Also

note that where original surveys offer a large number of individual education qualification variables, use a highest level of completed education variable. If only a number of qualifications is offered and no highest level of education variable is available, we create a highest level of education from the available variables in the original survey.

EDCAT: Harmonised highest level of education - HAF HSF only

This variable contains the harmonised diarists' highest education level. It is based on the <u>International Classification of Education (ISCED)</u>. This variable proved one of the most difficult to harmonise. In earlier versions of the MTUS, this variable had the column name EDTRY.

Value	Label	ISCED equivalent
1	uncompleted secondary or less	Not completed ISCED level 3
2	completed secondary	Completed ISCED level 3 and/or
		attendance at level 4
3	above secondary education	ISCED level 5 or above

This variable refers to the diarist's highest level of education completed (in the case of '1' and '2') or attended (in the case of '3').

•

4.5 Health variables

- RUSHED CARER
 - HEALTH DISAB

RUSHED: Whether diarist generally feels rushed - HAF only

This variable indicates self-reported feelings of time pressure. If the scale includes more categories in the original, make the most logical collapse of categories.

Value	Label	
0	Almost never	
1	Sometimes	
2	Often	

HEALTH: Diarist's general health - HAF only

This variable indicates is drawn from a self-reported general health status.

Value	Label
0	Poor
1	Fair
2	Good
3	Very good

CARER: Diarist looks after an adult or child with a disability - HAF only

This variable indicates whether the diarist provides any level of routine care to an adult who needs regular assistance with daily living or looks after a child whose disability or health condition requires more than the standard child care a child of that age might typically require.

Value	Label
0	No
1	Yes

DISAB: Diarist has disability / limiting health condition - HAF only

This variable indicates whether or not the diarist has a disability or long-term health limiting condition.

Value	Label
0	No
1	Yes

It should be noted that the way disability is defined tends to vary across surveys, which may affect the degree of cross-survey comparability. We attempt to ensure consistency in the coding across time in the same country. Also, where possible, we use health variables and not economic activity status to code this variable (thus allowing users to identify working people with disabilities). When such distinctions are not possible and the only information is from a main economic activity status variable, we add a note in the Readme documentation file.

CHAPTER 5: WEIGHTS IN MTUS

Time diary analysis requires two levels of weighting. First, as in all surveys, weights are needed to bring the sample in line with the population from which it was drawn. Second, weights also balance seasonal variations and variations by day of the week.

The MTUS aggregate file contains the following two weights:

- OCOMBWT: Original weight (population & day preferred, or whatever original weight is available if not combined);
- PROPWT: Proposed weight (population & day combined weight rescaled if needed) (see below about the rescaling procedure).

The simple file contains only propwt.

The episode file does not contain weights for two reasons, First, the weights are calculated at the diary level. Non-response and sample distribution adjustments can be addressed at the level of the diary and the diarist. The meaning of an episode level weight is less clear. There is no way of knowing how many diaries are less detailed than the diarists' actual days or the degree to which activities are under-reported at the episode level. While the sample distribution can be reasonably accurately estimated, it is not possible to estimate the true distributions of episodes in a meaningful way. Second, the meaning of an episode varies by the context of the research purpose (discussed more in the next chapter). As there is not a set unit for all analysis at the episode level, the episode file is best treated as a database from which variables are extracted to match back into the aggregate version for analysis.

Some surveys inflate the sample size by a factor to mirror the size of the whole population of the country. If the original weight is inflated, OCOMBWT should be left inflated.

Nevertheless, to promote consistency among the datasets and to prevent surveys from countries with larger populations from apparently swamping surveys from countries with smaller populations, we deflate the original weight in the computation of PROPWT. The mean of the original weight will sum to the inflation factor. Where survey designs collect diaries on a weekday and a weekend day, it is advisable to use the mean of the weekday diaries to deflate weekday diaries and the mean of the original weight for the weekend diaries to deflate the weekend diaries.

If the survey does not include a weight, OCOMBWT should be set to 0. Researchers have to find official statistics describing the population by age and sex. We recommend the United Nations publication *"World Population Prospects"* which contains time-series (since 1950) of the population by age and sex for each country. Alternative internationally recognised sources, such as the ILO Yearbook also may be used. If the survey has enough cases for you to split age and sex groups by employment status (using emp, employed or not employed) – this means if you have at least 50 cases of working and not-working for each sex and age group – then also include employment status. Note that you may not include employment status for the youngest and oldest diarists if few are working, but include emp for the working age population.

The main MTUS weight, PROPWT, is calculated by:

- 1- Begin from the original survey weight (deflated if the original weight was inflated). If there is no original weight, construct a population weight by dividing the percentage of the population you would expect to be in each age/sex (and in some cases employment status) group by the percentage of cases you actually have in that age/sex (/employment status) category in the sample data (expected/achieved).
- 2- Create a good-diary inflation factor by dividing the total number of diaries collected in the survey by the number of good diaries (total diaries/good diaries).
- 3- Create an interim weight that starts with the same value of the weight in step 1. Second, set the value of this interim weight to 0 for all low-quality diaries (BADCASE=0). Third, multiply your interim weight by the good diary inflation factor you created in step 2 for all cases (it will stay 0 for the bad diaries).
- 4- Compute ASEWT a sum of the weights for each age/sex(/employment status) group (across all days of the week).
- 5- Compute two further sums: ASEDayWT a sum of weights for each age/sex (/employment status) group separately for each day of the week, and also: ASEDayCASE the sum of the number of cases in each age/sex(/employment status) group for each day of the week. (This step differs from step 4 as now you calculate the sums separately for each day of the week).
- 6- Compute an expected sum of weights (ESW) for each day of the week: ESW = ASEWT / 7 (divide by 7 as there are 7 days of the week).
- 7- PROPWT = (ESW / ASEDayWT) / (ASEDayCASE / ASEDayWT)
- 8- Check that the weight has calculated correctly. PROPWT should have a mean of 1, and PROPWT should sum to the total number of diary cases. When the weight has been applied, the weighted frequency of the diaries

by the days of the week should be evenly distributed (14.3% for each day). Similarly, each age/sex group should have an even distribution of diaries across each day of the week.

CHAPTER 6: ANALYSIS OF TIME-USE DATA

In order to work with time use data, users should consider the nature of the data which diaries collect and also the population which is sampled. We begin this chapter by outlining key elements of time use data. We then offer some basic tips for working with diary data.

6.1 The data which time diaries collect

Time diaries collect stories. Even when presented in the quantitative data format, the diary row still represents a story and can be read as a story. Users should keep this narrative element of time use data in mind when working with the MTUS or any other time diary dataset.

The elements of a quantitative diary are not mutually exclusive but overlapping domains. In most cases, the domains in a diary are separate. Knowing that a person was reading does not cover the whole picture, as there are many qualitative differences between reading while on the beach but also keeping an eye on the children, reading alone in the house while drinking a glass of wine and listening to music, and reading while standing on crowded public transport at rush hour. Nonetheless, there are some cases where the domains overlap. Taking the train to work is simultaneously a location, a mode of transport and an activity. Washing and changing a baby is an activity, but also an activity in which the presence of the baby is a necessary element, and hence this activity also indicates that a child was present.

A second dimension of the narrative quality of diary data that users should keep in mind is that the ordering of elements reported in the diary is not always the motivator of the next element of behaviour in a diary sequence. This fact can be obscured as the first column diarists typically are asked to fill in when accounting for their day is called "main" or "primary" activity. Diary instructions generally distinguish main activity from simultaneous activities people are doing at the same time. Nonetheless, the record in the main activity column is not always the dimension of an episode which is the most important to the diarist. The main activity may be eating, but the most important element of the activity for the diarist might be that her children or the person he has wanted to date for months is joining the diarist during the meal.

A third key dimension of the narrative element of diary data is that accounts are mediated the participants. Diarists do not report activities they consider irrelevant, risky, shameful or compromising. Participants also report those activities which they notice and consider of sufficient importance to report. Some activities, such as violence and illegal behaviour, seldom appear, and diarists in some cultures report sexual behaviour, while others do not. People focussed on a particular activity (such as caring for an adult, or an intensive day on the job) may forget to report an essential activity like eating if they periodically fit the behaviour into short sessions of browsing food in between other intensive activity. The absence of a report does not mean that people did not undertake a particular activity. Likewise, absence of particular reports in and of themselves reveal what populations consider to be unimportant or not fit for public discussion.

Time diaries sample sequences of activities. Many constraints influence our patterns of behaviour. The weather, our general health, how energetic we feel at any given moment, where we are in relation to resources and facilities, the money and time we have to spend at any particular point, social expectations, the basic needs of our bodies, requirements of our care or paid work responsibilities are among the many constraints which limit the range of patterns of actions in which each individual might engage on any particular day. One way to measure patterns of daily activity involves following particular individuals over time and collect a rich and detailed dataset about their behaviour (though the expense of such collection means that the sample necessarily must be small). Such a strategy will reveal what a particular person typically does at a particular stage in that person's life. Alternatively, a researcher can collect snapshots over a day or small number of days for a large number of people to get a sense of what patterns of behaviour occur across the population. The time-diary data included in the MTUS is of the latter variety. Large-scale diary surveys reveal what patterns of behaviour most regularly occur across a population and which groups of people are most likely to engage in different forms of behaviour. Largesample diary surveys do not reveal the full range of activities of any specific participant, but do reveal what people with similar characteristics to any given diarist are more likely to be doing on different days and at different times.

A related consequence is that time diary surveys do not produce normal distributions for all activities. People only can do so much in one day, and no one can do every activity they normally undertake on any single day. Some researchers unfamiliar with time diary data have over-used Tobit models on the grounds that large numbers of 0-time cases appear for most activities. Nevertheless, MTUS users should keep in mind that Tobit models assume that large numbers of 0 cases appear because of censorship of reporting imposed by

the survey design. In some limited cases, 0s for some activities may represent censoring, but in general, the 0s represent real behaviour – people cannot do everything every day. For most time use diary analysis, users will need models which allow for real 0s in sequences of activities which occur over 24-hours.

Diaries will not reveal the full range of patterns of any given individual over longer periods. The unit of analysis is the sequence of activities or the summary time of activities for groups over 24-hours. For those activities which people undertake virtually every day (the domains noted elsewhere which we use as one dimension of distinguishing good-quality from low-quality diaries), we expect to observe at least one of the regular patterns of engagement in rest/sleep, eating or drinking, personal care and exercise or travel. For activities in which people generally engage on a less-than-daily basis, the diary data will reveal what people who undertake the activity do on days when they engage in the activity, but the diary data alone do not reveal whether any particular person ever undertakes the activity. To obtain this information, the survey designers would have to add supplementary questions to the diary asking participants if they ever undertake a particular activity, and if they do, how often they typically engage in that activity). While diary data can reveal which groups of people are most likely to take up an activity, diary data do not reveal total participation rates of activities people generally do not perform every day.

6.2 Basic analysis

People new to time use research should keep in mind a number of basic principles about working with this data. First, time is a rare commodity in that it is one of the few concepts we use on a daily basis but measure in units of 60 rather than in metric units. When modelling time, researchers use continuous measures such as of total minutes per day or week, participation rates, or the likelihood of categories of people engaging in a particular sequence of behaviours or not participating in such activities. When the final analysis produces figures in minutes (per day or per week), though, if the number of minutes involved is large, researchers are wise to report the findings in weeks, hours and minutes rather than just in minutes. Reporting that a group sleeps and average of 475 minutes on weekdays but an average of 525 minutes on weekends does not present the information in a meaningful way to most readers. Reporting that a group sleeps and average of 7 hours and 55 minutes on weekdays but an average of 8 hours and 45 minutes on weekends is meaningful to a wider audience. The Centre for Time Use Research maintains a minutes to weeks, hours and minutes calculator on its web site to facilitate such more meaningful reporting.

When time use researchers initially investigate data, they tend to produce three parallel sets of statistics:

- Average time spent in the activity over a 24-hour day of the whole population (total mean);
- Average time spent in the activity over a 24-hour day by those persons who undertook the activity on their diary day (participation mean);
- The proportion of the population who undertook the activity on their diary day (participation rate).

All three statistics have significant value. Knowing that people in a particular country work significantly fewer hours on night shifts over a 15 year period can mean multiple things. It might mean that fewer people work nights, but those who work nights continue to work similar shifts. It equally might mean that significantly fewer people work nights, but those who work nights work longer shifts. It also might mean that more people work nights but that they work shorter night shifts than in the past. To get a rounded picture, a researcher should calculate all three of these figures for basic analysis.

Time use collects general information. Concepts often can overlap, and many activities could fit into several different topics of analysis. If a researcher is interested in time that parents spend with children, passive supervisory care, playing active sports with children, helping with homework and showing children how to do things, physical and medical care, time escorting or travelling with children, and time when children are present but parents and their children are not interacting are all relevant. If the researcher is interested in travel to work, recorded commuting is relevant, but so is travel taking a child to school or day care before then travelling to the office, or walking a dog from the home to the office where the diarist records pet care as primary activity also are relevant to understanding how people get to work. If the researcher is interested in measuring the total physical activity of the population, sport and exercise are relevant, but so too are time travelling by physically active means (including walking and cycling), time playing outside with children (often coded in child care activity ranges), and time in active care or physically active housework. These examples demonstrate that an activity like walking a child to day care can fit into the concept of child care, commuting or exercise. Researchers need to approach analysis by considering the total range of areas in the diary in which a person might record an activity of interest to that concept.

Similarly, the meaning of a sequence of activity likewise can vary by the nature of the concept the researcher investigates. In some cases, a sequence may include the presence of other activities outside the main domain of interest. If the researcher wishes to record the degree to which paid work impacts work-life balance, an episode of paid work may include time that is not spent working (taking a break, doing personal or household activities on the computer while at

work, as examples). Similarly, if the researcher wishes to profile how having children impacts on parent's time use, time when the child is not present (such as waiting for a child to come out of school or working on paperwork for the child when the child is not present) would count as an episode of interest, and the episode would continue once the child arrives. In other cases, a change of activity out of a domain of interest would constitute and end of an episode. If the researcher is measuring total exercise time, time when a person stops physical activity to take a drink or meal break would not count as a continuation of the exercise episode. If the researcher is interested in time when children learn verbal language skills from their parents, time when the parents and children are not interacting does not count as the continuation of an episode. Researchers need to think about what constitutes a string of relevant information when deciding how they plan to use the time diary data.

Variable and value labels (in SPSS syntax) for the Harmonised Aggregate File. Labels are listed in the order in which the variables appear in the file.

variable label

'Country of survey' country 'Year survey began (survey id)' 'longitudinal study wave marker'.

value label

swave 0 'not longitudinal study/case'

survey

swave

- 1 'Wave 1'
- 2 'Wave 2'
- 3 'Wave 3'
- 4 'Wave 4'.

variable label 'multiple samples in study'. msamp

value label

msamp

- '1 sample' 0
- 1 'Szalai USA 65 sample'
- 2 'national USA 65 sample'
- 3 'USA 1998-99'
- 4 'USA 2000-01'
- 5 'Slovenia in Szalai Yugoslavia'
- 'Serbia in Szalai Yugoslavia' 6
- 'UK 1987, main sample, drawn from SCELI survey' 7
- UK 1987, spouses and additional household members 8
- East Germany 9
- West Germany 10
- 11 Basque Country in Spain.

'Household identifier'. variable label hldid

value label hldid

> '1 person sampled per household'. 0

variable label	persid	'Person/diarist identifier'
	id	'Diary identifier'
	parntid1	'Person id 1st parent of diarist'
	parntid2	'Person id 2nd parent of diarist'
	partid	'Person id of spouse or partner'.
value label	parntid1 parr	ntid2

- could not be created -9
- could not identify parent in hh -8
- -7 diarist does not live with parent.
- value label partid
 - could not be created -9

could not identify partner in hh

diarist does not have partner. -7

variable label value label

'Day of week diary kept'. day day

- - Sunday 1
 - 2 Monday
 - 3 Tuesday 4
 - Wednesday
 - Thursday 5
 - Friday 6
 - 7 Saturday
 - Whole week average 8
 - Unspecified weekday 9
 - 10 Unspecified weekend day
 - -8 missing
 - -9 could not be created.

variable label	month	'Month diary kept'.
value label	month	
4	1	

- January 1 2
 - February
- 3 March
- April 4
- May 5
- 6 June
- 7 July
- 8 August
- 9 September
- 10 October
- 11 November
- 12 December
- -8 missing
- -9 could not be created.

variable label	year	year diary kept.

- value label year
 - -8 missing
 - -9 could not be created.

variable labe	,	Diary order.
value label	diary	
1	1st diary day	

Variable and value labels in English

- 2nd diary day 3rd diary day 4th diary day 5th diary day 6th diary day

- 2 3 4 5
- 6
- 7
- 7th diary day Weekly average missing 8
- -8
- -9 could not be created.

variable labe			
value label	badcase		
0	good case		
1	miss age or sex only		
2	miss day of week only		
3	"miss 91+ minutes only"		
4	"<7 episodes only"		
5	"miss 2+ basic acts only"		
6	"miss age/sex + day of week"		
7	"miss age/sex + 91+ min"		
8	"miss age/sex + <7 episodes"		
9	"miss age/sex + 2+ basic acts"		
10	"miss day of week + 91+ min"		
11	"miss day of week + <7 episodes"		
12	"miss day of week + 2+ basic acts"		
13	"miss 91+ min + <7 episodes"

29	"miss age/sex + 91+ min + <7 episodes + 2+ basic acts"		
30	"day of week + 91+ min + <7 episodes + 2+ basic acts"		

bad on all five points.

variable label hhtype Household type. value label hhtype

- 1 person household
- 2 'Married/cohabiting couple alone'
- 3 'Married/cohabiting couple + others'
- 4 Other household types
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created'.

variable label hhldsize # people in household.

- value label hhldsize
 - -7 'not applicable/not asked'
 - -8 missing
 - -9 could not be created.

variable label nchild '# child aged<18 in hhold'.

- value label nchild
 - -7 'not applicable/not asked'
 - -8 missing
 - -9 could not be created.

variable label

agekidx "Age youngest child in hhold (includes adult children)". value label agekidx

- 1 'age 0-4'
- 2 'age 5-12'
- 3 'age 13-17'
- 4 adult child
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label agekid2 Actual age youngest child in hhold.

value label agekid2

- 60 60 or older
 - -7 'not applicable/not asked'
 - -8 missing
 - -9 could not be created.

variable label incorig 'Original household income'

income 'Total hhold income grouped'.

value label -9

incorig not available in survey.

- value label income
 - 1 'lowest 25%'
 - 2 'middle 50%'
 - 3 'highest 25%'
 - -7 'not applicable/not asked'
 - -8 missing
 - -9 could not be created.

variable label ownhome owns or rents home. value label ownhome

- 1 own outright or mortgage
- 2 rents
- 3 other
- -8 missing
- -9 could not be created.

variable label urban Urban or rural hhold. value label urban

- 1 'urban/suburban'
- 2 'rural/semi-rural'
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label computer 'hhold has computer/internet access'. value label computer

- 0 no
- 1 yes
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label vehicle hhold access to a private vehicle. value label vehicle

- 0 no
 - 1 animal only
 - 2 non-motorised vehicle
 - 3 '1 car/motorcycle'
 - 4 '2+ cars/motocycles'
 - -8 missing

could not be created.

variable label	sex	Sex.
value label	sex	

- 1 man
 - 2 woman
 - -8 missing.

variable label Age. age

- value label age
 - 90 90 or older
 - -7 not asked
 - -8 missing.

Individual level family status. famstat

value label famstat

variable label

- 'Aged 18 to 39 with no coresident children <18' 0
- 1 'Aged 18+ living with 1+ coresident children aged <5'
- 2 'Aged 18+ living with 1+ coresident children 5-17, none <5'
- 3 'Aged 40+ with no coresident children <18'
- 4 'Aged <18 and living with parent(s)/guardian(s)'
- 5 'Aged <18, living arrangement other or unknown'
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label singpar diarist a single parent. value label singpar

- No 0
- 1 Yes
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label relrefp 'Relation to hhold ref person'.

- value label relrefp
 - 1 person 1
 - 2 'spouse/partner'
 - 3 child
 - 4 parent
 - 5 sibling
 - 6 'son/daughter-in-law'
 - 7 'parent-in-law'

- 'brother/sister-in-law'
- 9 other relative
- 10 not related
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label civstat is diarist in a couple. value label civstat

- 1 'in couple (married/cohabit/civil partnership)'
- 2 'not in couple'
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label diarist cohabiting. cohab

value label cohab

0

- no, married
- 1 yes, cohabiting
- -7 'not in couple'
- -8 missing
- -9 could not be created.

variable label	citizen	'Diarist is citizen/national of country'.
value label	citizen	

- - 0 no
- 1 yes
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label empstat employment status. value label empstat

- 'full-time' 1
 - 2 'part-time'
 - 3 unknown job hours
 - 4 not in paid work
 - 'not applicable/not asked' -7
 - -8 missing
 - could not be created. -9

variable label	emp	in paid work.
value label	emp	

- 0 not in paid work
- 1 in paid work
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label unemp unemployed. value labels unemp

- 0 no
- 1 yes
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label student Student status.

- value label student
 - 0 not student
 - 1 student
 - -7 'not applicable/not asked'
 - -8 missing
 - -9 could not be created.

variable label retired Retirement status. value label retired

- 0 not retired
 - 1 retired
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label empsp 'Emp status spouse/partner'. value label empsp

- 1 'full-time'
- 2 'part-time'
- 3 unknown job hours
- 4 not in paid work
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label workhrs Hours paid work last week inc overtime. value label workhrs

-7 'not applicable/not asked'

missing

could not be created.

variable label empinclm Orig monthly labour income. empinclm value label

- 'not applicable/not asked' -7
- -8 missing
- -9 could not be created.

variable label	occupo	Original occupation
	isco1	ISCO 2008 1-Digit Occupation.
value label	isco1	

value label

- 0 armed forces and security
- 1 managers, senior officials and legislators
- 2 professionals
- 3 technicians and associate professionals
- 4 clerical workers
- 5 service and sales workers
- 6 skilled agriculture, fishery, forestry workers
- 7 craft and related trades workers
- 8 plant and machine operators and assemblers
- 9 elementary occupations
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label Sector of employment. sector value label

- sector
 - public sector 1
 - 2 private sector
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label	educa	'Education-original study codes'
	edcat	'Harmonised highest level of education'.

value label educa

- -9 not available in survey.
- value label edcat
 - 1 'inc 2ndry or less'
 - 2 'completed secondary'
 - 3 'above 2ndry education'
 - -7 'not applicable/not asked'

8 missing

-9 could not be created.

variable label rushed Whether diarist ususally feels rushed. value label rushed

- 0 almost never
- 1 sometimes
- 2 often
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

variable label health "Diarist's general health".

value label health

- 0 poor
- 1 fair
- 2 good
- 3 very good
- -7 'not applicable/not asked'

carer

disab

- -8 missing
- -9 could not be created.

variable label	

value label

diarist provides adult care

'has disability/long-term health condition'.

- disab carer
- 0 no
- 1 yes
- -7 'not applicable/not asked'
- -8 missing
- -9 could not be created.

Appendix 3 Notes on variables from surveys yet to be upgraded

The MTUS project developed as and remains a labour of love, increasing access to quality harmonised time use surveys to a wider range of data users. The process of converting a time use survey into this format takes a minimum of three weeks of work. MTUS does not charge users for this process, and the Centre for Time Use Research which maintains the MTUS includes few staff. As a result, the process of adding or upgrading surveys takes time, and we have placed more priority on adding new data over upgrading older data. Users should note a number of differences between older versions and the current version of the MTUS, detailed in the following table. Users should read this appendix in conjunction with Chapter 2 and Table 3.3 (which maps the old MTUS 41 activity categories to the new MTUS categories on which we base the 25 simple activity categories).

Version of MTUS and surveys	Countrya	Survey	Msamp
adapted from this verion	Country or region of survey	Year survey began	multiple samples in study
W5.53 (from 2006)			
Denmark 1964, 1987	Included in current MTUS	Included in current MTUS	Included in current MTUS
Germany 2001-02	format	format	format
Italy 2002-03			
W5.52 (from 2000)			
Canada 1971, 81, 86, 92, 98	Adapted from old variable	Reflects one of the survey	Set to 0 for all surveys, was
Norway 1971, 81, 1990, 2000	Country, direct swap of old	years, but not necessarily the	not in the MTUS version
Slovenia/Yugoslavia 2000	for new values	first year of the survey	
United Kingdom 1961			
W50 (pre 2000)			
France 1965, 1974-75	Adapted from old variable	Reflects one survey year, not	East and West Germany
Germany 1965	Country, direct swap of old	necessarily the first year, was	distinguished, insufficient
Italy 1979-90	for new values	2 digits, 1900 added to make	information to split Serbia
Slovenia/Yugoslavia 1965		4 digit year	from Slovenia

Version of MTUS and surveys	Hldid	Persid	Id
adapted from this verion	Household identifier	Person/diarist identifier	Diary identifier
W5.53 (from 2006)			
Denmark 1964, 1987	Included in current MTUS	Included in current MTUS	= persid for surveys that
Germany 2001-02	format	format	collected 1 diary per
Italy 2002-03			household
W5.52 (from 2000)			
Canada 1971, 81, 86, 92, 98	Included in current MTUS	Included in current MTUS	= persid for surveys that
Norway 1971, 81, 1990, 2000	format	format	collected 1 diary per
Slovenia/Yugoslavia 2000			household, except for
United Kingdom 1961			Canada, where set to 1
W50 (pre 2000)			
France 1965, 1974-75	Set to 0 for all cases, was not	Set to the value of ID, which	Set to 1 for all cases
Germany 1965	included in this version	was the only identifier and a	Was the only identifier and a
Italy 1979-90	originally	diary case id only originally	diary case id only originally
Slovenia/Yugoslavia 1965			

Version of MTUS and surveys	Day	Month	Year
adapted from this verion	Day of week diary kept	Month diary kept	Year diary kept
W5.53 (from 2006)	Included in current MTUS	Included in current MTUS	Included in current MTUS
	format	format	format
W5.52 (from 2000)	Included in current MTUS	Included in current MTUS	Included in current MTUS
	format	format	format
W50 (pre 2000)	Included in current MTUS	Set to -9, not included in this	Set = survey, originally not
	format	MTUS format	included in this MTUS format

Version of MTUS and surveys	Hhldsize	Nchild	Agekidx
adapted from this verion	# of people in household	# child aged<18 in household	Age youngest child in hhold
W5.53 (from 2006)			
Denmark 1964, 1987	Included in current MTUS	Included in current MTUS	Included in current MTUS
Germany 2001-02	format	format	format
Italy 2002-03			
W5.52 (from 2000)			Covers groups 0-4, 5-12, 13-
Canada 1971, 81, 86, 92, 98	Included in current MTUS	Included in current MTUS	17, but households with adult
Norway 1971, 81, 1990, 2000	format	format	children or no member who is
Slovenia/Yugoslavia 2000			child of another member not
United Kingdom 1961			distibguished
W50 (pre 2000)	Adapted from HHTYPE	Adapted from FAMSTAT	Adapted from FAMSTAT
France 1965, 1974-75	1 person household = 1	Adult with no child = 0	Adult with no child = -7
Germany 1965	Couple alone = 2	Adult living with child = 1	Adult living with child aged <5
Italy 1979-90	Couple + others and other	_	= 1 (aged 0-4); Adult living
Slovenia/Yugoslavia 1965	household types = 3		with older child = 3

Version of MTUS and surveys	Income	Urban	Sex
adapted from this verion	Total household income	Urban or rural household	Sex
W5.53 (from 2006)	Included in current MTUS	Included in current MTUS	Included in current MTUS
	format	format	format
W5.52 (from 2000)	Included in current MTUS	Included in current MTUS	Included in current MTUS
	format	format	format
W50 (pre 2000)	Included in current MTUS	Set to -9, not included in this	Included in current MTUS
	format, but only for Fance	MTUS format	format
	1974-75		

Version of MTUS and surveys	Age	Civstat	Empstat
adapted from this verion	Age	Is diarist in a couple or single	Employment status
W5.53 (from 2006)			
Denmark 1964, 1987	Included in current MTUS	Included in current MTUS	Included in current MTUS
Germany 2001-02	format	format	format
Italy 2002-03			
W5.52 (from 2000)			
Canada 1971, 81, 86, 92, 98	Included in current MTUS	Included in current MTUS	Included in current MTUS
Norway 1971, 81, 1990, 2000	format	format	format
Slovenia/Yugoslavia 2000			
United Kingdom 1961			
W50 (pre 2000)			
France 1965, 1974-75	Only ages 20 to 59 included	Included in current MTUS	Only covers full-time
Germany 1965	in this version of the MTUS	format	employed, part-time
Italy 1979-90			employed, not working, see
Slovenia/Yugoslavia 1965			Chapter 2 for other variations

Version of MTUS and surveys	Workhrs	Empinclm	Edcat
adapted from this verion	Hours paid work last week	Monthly labour income	Highest level of education
W5.53 (from 2006)	Included in current MTUS	Included in current MTUS	Renamed EDTRY, otherwise
	format	format	in current MTUS format
W5.52 (from 2000)	Included in current MTUS	Included in current MTUS	Renamed EDTRY, otherwise
	format	format	in current MTUS format
W50 (pre 2000)	Included in current MTUS	Set to -9, not included in this	Renamed EDTRY, otherwise
	format	MTUS format	in current MTUS format

Version of MTUS and surveys	Sleep	Eatdrink	Selfcare
adapted from this verion	Sleep and naps	Meals or snacks	Wash, dress, care for self
W5.53 (from 2006)			
Denmark 1964, 1987	AV16, largely similar to	AV15, largely similar to	AV13, largely similar to
Germany 2001-02	current MTUS version	current MTUS version	current MTUS version
Italy 2002-03
